CHAPTER 0: REVIEW	1
1. Solution of second order ordinary differential equations by series	1
2. Regular singular points	10
3. Series solutions near a regular singular point	11
CHAPTER 1: BOUNDARY VALUE PROBLEMS	17
1. Introduction	17
2. Adjoint differential equations and boundary conditions	25
3. Self -adjoint systems	30
4. A broader approach to self-adjoint systems	34
5. Sturm-Liouville theory	36
6. Introduction to orthogonality and completeness	42
CHAPTER 2: SPECIAL FUNCTIONS	60
1. Hypergeometric series	60
2. Bessel functions	89
3. Legendre polynomials	120
4. Gamma function	128
CHAPTER 3: SYSTEMS OF ORDINARY DIFFERENTIAL EQUATIONS	131
1. Introduction	131
2. Method of elimination	134
3. Some linear algebra	136
4. Linear systems with constant coefficients	145
5. Linear systems with variable coefficients	149
6. Elements of linear control theory	153
7. The Laplace transform	161

CHAPTER 4: APPLICATIONS OF SYMMETRY PRINCIPLES TO DIFFERENTIAL EQUATIONS	169
1. Introduction	169
2. Lie groups	170
3. Lie algebras	174
4. Prolongation of the action	179
5. Invariant differential equations	185
6. The factorization method	193
7. Examples of factorizable equations	198
CHAPTER 5: EQUATIONS WITH PERIODIC COEFFICIENTS	210
1. Introduction	210
2. Floquet theory for periodic equations	215
3. Hill's and Mathieu equations	222
CHAPTER 6: GREEN'S FUNCTIONS	228
1. Introduction	228
2. General definition of Green's function	231
3. The interpretation of Green's functions	235
4. Generalized functions	241
5. Elementary solutions and Green's functions	246
6. Eigenfunction representation of Green's functions	250
7. Integral equations	254
CHAPTER 7: PERTURBATION THEORY	263
1. Preliminaries	263
2. Some basic ideas-regular perturbations	267
3. Singular perturbations	275
4. Boundary layers	280
5. Other perturbation methods	285
*6. Perturbations and partial differential equations	291
*7. Perturbation of eigenvalue problems	296
*8. The Zeeman and Stark effects	301
CHAPTER 8: PHASE DIAGRAMS AND STABILITY	308
1. General introduction	308
2. Systems of two equations	313
3. Some general theory	328
4. Almost linear systems	334
5. Almost linear systems in R^2	338
6. Liapounov direct method	344
7. Periodic solutions (limit cycles)	350

CHAPTER 9: CATASTROPHES AND BIFURCATIONS	356
1. Catastrophes and structural stability	356
2. Classification of catastrophe sets	363
3. Some examples of bifurcations	369
4. Bifurcation of equilibrium states in one dimension	379
5. Hopf bifurcation	390
6. Bifurcations in \mathbb{R}^n	394
CHAPTER 10: STURMIAN THEORY	401
1. Some mathematical preliminaries	401
2. Sturmian theory for first order equations	407
3. Sturmian theory for second order equations	413
4. Prüfer transformations	420
