Preface

1	The Solution of Ordinary Differential Equations	1
1.1	Introduction	
1.2	Formation of differential equations from given solutions	
1.3	Change of the dependent variable	
1.4	Change of the independent variable	
1.5	General solution derived from a knowledge of one solution	
1.6	Variation of parameters	
1.7	Series solutions	
2	The Physical Problems	24
2.1	Complex representation of harmonically varying quantities	
2.2	Waves on a stretched string with varying mass density	
2.3	Oscillations of a heavy hanging string	
2.4	Electric waves in an inhomogeneous isotropic medium	
2.5	Electric waves in an inhomogeneous anisotropic medium	
2.6	Linear motion of a particle in quantum mechanics	
2.7	The phenomena to be investigated	
3	Energy Considerations	53
3.1	The energy balance equation	
3.2	Application to the most general linear second order equation	
3.3	Boundary conditions	
3.4	Two examples	
4	The General Nature of Wave Propagation	65
4.1	Energy calculations and wave amplitudes	
4.2	Properties of two-way propagation	
4.3	Expressions for the reflection coefficient	
5	Reflection from Slabs	78
5.1	Incidence on a semi-infinite slab with transmitted wave	
5.2	Incidence on a semi-infinite slab with evanescent wave	
5.3	Incidence on a semi-infinite slab of highly conducting material	
5.4	Propagation within a well embedded in overdense media	
5.5	Propagation within a well bounded by two fixed end points	

5.6	Propagation through a semi-transparent slab	
5.7	Propagation through an almost opaque slab	
5.8	Complete transmission through two almost opaque slabs	
5.9	Reflection from a tarnished mirror	
5.10	Transmission through a series of homogeneous slabs	
5.11	Alternative method for a series of slabs	
5.12	A chain of N identical slabs	
6	Construction of the Reflected Wave	104
6.1	External effects of a thin slab	
6.2	A model for reflection processes from an extended medium	
6.3	Mathematical derivations of the integral equation	
6.4	Use in approximation theory to the second order	
6.5	Two examples of the approximate reflection formula	
7	Asymptotic solutions	114
7.1	The asymptotic solution via the Riccati equation	
7.2	The Sonin-Polya theorem	
7.3	Examples of the W.K.B.J. solutions	
7.4	The integral equation	
7.5	Estimation of the accuracy of the approximations	
7.6	Matrix methods	
7.7	The physical meaning of the wave-like solutions	
7.8	Energy considerations	
7.9	Reflection problems without transition points	
7.10	Connection formulae for solutions of the Stokes equation	
7.11	Connection formulae for the W.K.B.J. solutions	
7.12	Reflection of waves by a single transition point	
7.13	The overdense potential barrier	
7.14	Investigation of the subdominant solution of the Stokes equation by means of its series expansion	
8	Pulses and Group Velocity	193
8.1	Definition of a vertically propagated pulse	
8.2	Group velocity	
8.3	The apparent height of reflection	

8.4	The distribution of refractive index using Abel's integral equation	
9	Exact Solutions of the Propagation Equation	205
9.1	Solution when a hint is given	
9.2	Manufacture of refractive index profiles from basic transcendental equations	
9.3	The simple harmonic equation as the basic equation	
9.4	The bilinear transformation	
9.5	Bessel's equation as the basic equation	
9.6	Reflection properties of an isotropic exponential model	
9.7	Booker's method for energy losses in an isotropic exponential model	
9.8	Reflection properties of an anisotropic exponential model	
10	Miscellaneous Considerations	232
10.1	Circle theorems	
10.2	Millington's treatment via the integration of the Riccati equation	
10.3	Wait's integral equation	
10.4	Poeverlein's coupled equations	
10.5	Static fields in inhomogeneous media	
11	Eigenvalues and Energy	251
11.1	Introduction	
11.2	Energy stored in the medium	
11.3	Equality of the total average potential and kinetic energies in a resonator	
11.4	General theorems on eigenvalues and eigensolutions	
11.5	Orthogonality of the eigensolutions	
11.6	Total energy in terms of the individual modes	
11.7	The homogeneous resonator	
11.8	Free space resonator bounded by semi-infinite overdense slabs	
11.9	The approximate calculation of the lowest eigenvalue	
11.10	The harmonic oscillator - variational method	
11.11	The harmonic oscillator - series-solution method	

- 11.12 The harmonic oscillator - the Hermite-polynomial method
- 11.13 The harmonic oscillator - the transcendental function method
- 11.14 The harmonic oscillator - the matrix method
- 11.15 The harmonic oscillator - special operator method
- 11.16 The harmonic oscillator - the W.K.B.J. method
- 11.17 Normalisation - Paul's approximate treatment
- 11.18 A well with an outside singularity - the W.K.B.J. treatment
- 11.19 A well with an outside singularity - exact treatment

Exercises	314
Bibliography	334
Index	334
