PART I — THEORY

1. INTRODUCTION	11
2. ORTHOGONAL FUNCTIONS	
2.1. Orthogonality	13
2.2. Weighting function; linear independence	15
2.3. Completeness	19
2.4. Orthogonalization of a system of functions	23
Problems	26
3. ORTHOGONAL POLYNOMIALS	
3.1. Classical and other polynomials	29
3.2. Recurrence formula	33
3.3. The Christoffel-Darboux formula	37
3.4. The classical polynomials	41
3.5. Differential equation	44
3.6. Rodriguez formula	47
3.7. Leading and second coefficients	51
3.8. Norms	53
3.9. Classical recurrence relations	55
3.10. Integral representation	56
3.11. Generating function	59
3.12. Permissible weighting functions	64
3.13. Some special cases	66
3.14. Orthogonal polynomials in the complex plane	84
3.15. Orthogonal polynomials of a discrete variable	86
Problems	93

PART II — APPLICATIONS

4. NUMERICAL ANALYSIS	
4.1. Introduction	97
4.2. Numerical integration	98
4.3. The minimum-error principle of orthogonal expansions	107
4.4. Chebyshev minimization	111
4.5. Interpolation by polynomials of a discrete variable	117
4.6. Telescoping orthogonal expansions	120
4.7. Side lobe suppression	124
Problems	129
5. PARTIAL DIFFERENTIAL EQUATIONS	
5.1. Separation of variables	131
5.2. Electrostatics and gravitation	134
5.3. Hydrodynamics	139
5.4. Quantum mechanics	142
5.5. Aberrations of focusing systems and Zernike polynomials	150
5.6. Transmission line theory	157
Problems	161
6. PROBABILITY THEORY AND RANDOM PROCESSES	
6.1. The Gaussian disease	163
6.2. Non-Gaussian two-dimensional probability densities	165
6.3. Canonical two-dimensional distributions	177
6.4. Distribution of the derivative of a non-Gaussian process	187
6.5. Fades, surges and level crossings of non-normal processes	194
6.6. Systems theory	197
6.7. Scattering of waves by statistically rough surfaces	203
Problems	206
<i>Appendix I.</i> On the non-negativity of a sum	211
<i>Appendix II.</i> Integrals and other relations involving orthogonal polynomials	218
References	274
