

Contents

Chapter I. Boundary value problems for linear equations	1
1. Sets of points; functions	1
2. Elliptic equations	5
3. Maximum and minimum properties of the solutions of elliptic equations	6
4. Various types of boundary value problems	8
5. Uniqueness theorems	10
6. Green's formula	12
7. Compatibility conditions for the boundary value problems; other uniqueness theorems	14
8. Levi functions	17
9. Stokes's formula	19
10. Fundamental solutions; Green's functions	20
Chapter II. Functions represented by integrals	23
11. Products of composition of two kernels	23
12. Functions represented by integrals	24
13. Generalized domain potentials	28
14. Generalized single layer potentials	32
15. Generalized double layer potentials	39
16. Construction of functions satisfying assigned boundary con- ditions	43
Chapter III. Transformation of the boundary value problems into integral equations	49
17. Review of basic knowledge about integral equations	49
18. The method of potentials	54
19. Existence of fundamental solutions. Unique continuation property	59
20. Principal fundamental solutions	67
21. Transformation of the Dirichlet problem into integral equations	73
22. Transformation of Neumann's problem into integral equations	82

23. Transformation of the oblique derivative problem into integral equations	86
24. The method of the quasi-Green's functions	92
Chapter IV Generalized solutions of the boundary value problems .	97
25. Generalized elliptic operators	97
26. Equations with singular coefficients and known terms	100
27. Local properties of the solutions of elliptic equations . . .	104
28. Generalized solutions according to Wiener of Dirichlet's problem	108
29. Generalized boundary conditions	110
30. Weak solutions of the boundary value problems	121
31. The method of Fischer-Riesz equations	134
32. The method of the minimum	143
Chapter V. A priori majorization of the solutions of the boundary value problems	146
33. Orders of magnitude of the successive derivatives of a function and of their HÖLDER coefficients	147
34. Majorization in $C^{(n, \lambda)}$ of the solutions of equations with constant coefficients	151
35. General majorization formulas in $C^{(n, \lambda)}$	154
36. Method of continuation for the proof of the existence theorem for Dirichlet's problem	164
37. General majorization formulas in $H^{k, p}$	169
38. Existence and regularization theorems	175
39. A priori bounds for the solutions of the second and third boundary value problem	179
Chapter VI. Nonlinear equations	180
40. General properties of the solutions	181
41. Functional equations in abstract spaces	188
42. Dirichlet's problem for equations in m variables	194
43. Dirichlet's problem for equations in two variables	208
44. Equations in the analytic field	212
45. Equations in parametric form	217
46. The Neumann and oblique derivative problems	219
47. Equations of particular type	221
Chapter VII. Other research on equations of second order. Equations of higher order. Systems of equations	223
48. Second order equations on a manifold	223

49. Second order equations in unbounded domains	225
50. Other problems for second order equations	233
51. Inverse problems and axiomatic theory for second order equations	242
52. Equations of higher order	243
A. Elliptic operators of higher order	244
B. Green's formula. Fundamental solutions. Cauchy's problem and the unique continuation property	245
C. Local properties of the solutions	249
D. Dirichlet's and general boundary value problems . . .	249
E. Equations on manifolds. Pseudo-differential operators. Non local boundary problems	259
F. Equations in unbounded domains	260
G. Equations in regions with degenerate boundary	261
H. Mixed and transmission problems	261
I. Polyharmonic functions	262
J. Nonlinear equations. Questions of analyticity	264
53. Systems of equations of the first order	265
54. Canonical form of elliptic equations	273
55. Systems of higher order equations	275
A. Elliptic systems	275
B. Green's formula. Fundamental matrix. Cauchy's problem and the unique continuation property	276
C. Boundary value problems	278
D. Systems of second order equations	281
E. Systems on manifolds. Pseudo-differential operators . .	282
F. Systems on unbounded domains. Transmission problems	283
G. Systems of equations from mathematical physics . . .	283
H. Nonlinear systems. Questions of analyticity	285
56. Degenerate elliptic equations. Questions of a small para- meter	285
Bibliography	289
