**Authors' preface** vii

**Translator's preface** ix

**1 Liapunov stability and related concepts** 1

- 1 Introduction 1
- 2 Stability and attractivity of an equilibrium 4
- 3 Definite or semi-definite functions 7
- 4 Sufficient conditions for stability 11
- 5 Sufficient conditions for instability 19
- 6 Stability in linear systems 24
- 7 Stability from the first approximation 30
- 8 Historical notes and references 35
- 9 Exercises 36

**2 Deeper questions in the theory of stability** 40

- 1 Introduction 40
- 2 Utilization of auxiliary functions which are not positive definite 41
- 3 The comparison method 43
- 4 The theorem of LaSalle on invariant sets 47
- 5 A theorem of Matrosov using two auxiliary functions 56
- 6 Attractivity of certain closed sets 62
- 7 Stability of a critical point when first integrals are known 68
- 8 Stability of periodic solutions 74
- 9 Historical notes and references 80
- 10 Exercises 82

**3 Periodic solutions to non-linear periodic differential equations** 85

- 1 Generalities 85
- 2 Operators associated with periodic solutions of linear periodic differential equations 90

- 3 Operators in  $C_T$  whose fixed points coincide with the periodic solutions of a non-linear periodic differential equation 98
- 4 Study of important special cases 100
- 5 Periodic solutions of vector differential equations of order higher than one 103
- 6 Historical notes and references 106
- 7 Exercises 108

#### **4 Periodic solutions of non-linear differential equations with a small parameter 112**

- 1 Non-linear perturbations of linear equations: fundamental theorem 112
- 2 Quasilinear differential equations in standard form 121
- 3 Quasilinear autonomous differential equations 126
- 4 Linear periodic perturbations of linear differential equations with constant coefficients 135
- 5 Stability of periodic solutions of quasilinear differential equations 143
- 6 Non-linear perturbations of non-linear equations 149
- 7 Examples 158
- 8 Historical notes and references 162
- 9 Exercises 164

#### **5 Periodic solutions of strongly non-linear periodic differential equations 167**

- 1 Elements of the theory of topological degree in  $\mathbf{R}^n$  167
- 2 Elements of the theory of topological degree in a Banach space 174
- 3 Some fundamental existence theorems for periodic solutions 179
- 4 The method of guiding functions 187
- 5 Periodic solutions of second order vector differential equations 189
- 6 Periodic solutions of vector equations of Lienard and Duffing 196
- 7 Review of Fourier series 205
- 8 The approximation method of Galerkin 209
- 9 The Cesari method 211
- 10 Convergent iteration methods based on Galerkin approximations 216
- 11 Historical notes and references 224
- 12 Exercises 228
