Approximations to Probabilistic Characteristics of Stochastic Differential Equations

 Springer

Contents

1	An Introduction to Malliavin Calculus	1
1.1	Probability Law and Wiener Functionals	2
1.2	Differential Structure on Abstract Wiener Space	13
1.3	Differential Calculus on Gaussian Space	23
1.4	Discrete Malliavin Calculus	44
1.5	Regularity and Approximation of Density	50
	References	62
2	Density of Langevin Equation and Its Approximation	67
2.1	Density of Stochastic ODEs	68
2.2	Density of Langevin Equation	80
2.3	Density Approximation Via Splitting Averaged Vector Field Method	90
	References	121
3	Density of Stochastic Heat Equation and Its Approximation	127
3.1	Density of Stochastic Heat Equation	128
3.2	Density Approximation via Accelerated Exponential Euler Method	142
3.3	Convergence Rate of Density Approximation	148
	References	179
4	Density of Stochastic Cahn–Hilliard Equation and Its Approximation	183
4.1	Absolute Continuity of Probability Laws	185
4.2	Density Convergence of Spatial Finite Difference Approximation	200
4.3	Density Convergence of Fully Discrete Approximation	229
	References	245

5 Hitting Probabilities for Approximations of Systems of Stochastic Heat Equations	247
5.1 Hitting Probability	248
5.2 Hitting Probability of Spatial Semi-Discrete Approximation	257
5.3 Hitting Probability of Temporal Semi-Discrete Approximation	269
5.4 Comparison with Approximations of System of Stochastic ODEs	273
References	281
6 Asymptotic Preservation of Probabilistic Behaviors of Stochastic Heat Equation	285
6.1 Large Deviations	286
6.2 Preservation of Large Deviations of Invariant Measures	299
6.3 Weak Intermittency	322
6.4 Preservation of Weak Intermittency	326
References	351
Appendix A: Gronwall-Type Inequalities	355
Appendix B: Itô–Taylor Approximation	363
Appendix C: Proofs of Propositions 2.4, 4.8, and 6.7	367
References	377
Index	379
