

Chapter Summaries

Introduction: A Glimpse at Set Theory 1

1. The Algebra of Sets, 1
Equality of sets, intersection, union, Cartesian product
2. Functions, 11
Tabular representation, transformations, restrictions and extensions, composition, injective and inverse functions, surjective and bijective functions, direct and inverse images
3. Finite and Infinite Sets, 22
Finite, countable, and uncountable sets, the uncountability of \mathbf{R} and \mathbf{I}

I. The Real Numbers 27

4. The Algebraic Properties of \mathbf{R} , 28
The field properties of \mathbf{R} , irrationality of $\sqrt{2}$
5. The Order Properties of \mathbf{R} , 32
Order properties, absolute value
6. The Completeness Property of \mathbf{R} , 37
Suprema and infima, Archimedean Property, the existence of $\sqrt{2}$
7. Cuts, Intervals, and the Cantor Set, 45
The Cut Property, cells and intervals, Nested Property, the Cantor set, models for \mathbf{R}

II. The Topology of Cartesian Spaces 52

8. Vector and Cartesian Spaces, 52
Vector spaces, inner product spaces, normed spaces, the Schwarz Inequality, the Cartesian space \mathbf{R}^p
9. Open and Closed Sets, 62
Open sets, closed sets, neighborhoods
10. The Nested Cells and Bolzano-Weierstrass Theorem, 68
Nested Cells Theorem, cluster points, Bolzano-Weierstrass Theorem
11. The Heine-Borel Theorem, 72
Compactness, the Heine-Borel Theorem, Cantor Intersection Theorem, Lebesgue Covering Theorem

12. Connected Sets, 80
The connectedness of intervals in \mathbf{R} , polygonally connected open sets are connected, connected sets in \mathbf{R} are intervals
13. The Complex Number System, 86
Definition and elementary properties

III. Convergence 90

14. Introduction to Sequences, 90
Convergence, uniqueness of the limit, examples
15. Subsequences and Combinations, 98
Subsequences, algebraic combinations of sequences
16. Two Criteria for Convergence, 104
Monotone Convergence Theorem, Bolzano-Weierstrass Theorem, Cauchy sequences, the Cauchy Criterion
17. Sequences of Functions, 113
Convergence, uniform convergence, the uniform norm, Cauchy Criterion for Uniform Convergence
18. The Limit Superior, 123
The limit superior and inferior of a sequence in \mathbf{R} , unbounded sequences, infinite limits
19. Some Extensions, 128
Order of magnitude, Cesàro summation, double sequences, iterated limits

IV. Continuous Functions 136

20. Local Properties of Continuous Functions, 136
Continuity at a point and on a set, the Discontinuity Criterion, combinations of functions
21. Linear Functions, 147
Linear functions, matrix representation, the norm
22. Global Properties of Continuous Functions, 150
Global Continuity Theorem, Preservation of Compactness, Preservation of Connectedness, Continuity of the Inverse Function Theorem, bounded continuous functions
23. Uniform Continuity and Fixed Points, 158
Uniform continuity, Lipschitz condition, Fixed Point Theorem for Contractions, Brouwer Fixed Point Theorem
24. Sequences of Continuous Functions, 165
Interchange of limit and continuity, approximation by step and piecewise linear functions, Bernstein polynomials, the Bernstein and Weierstrass Approximation Theorems

25. Limits of Functions, 174
Deleted and non-deleted limits, the deleted and non-deleted limit inferior, semi-continuity
26. Some Further Results, 182
The Stone and Stone-Weierstrass Approximation Theorems, Polynomial Approximation Theorem, Tietze's Extension Theorem, equicontinuity, Arzelà-Ascoli Theorem

V. Functions of One Variable 193

27. The Mean Value Theorem, 193
The derivative, Interior Maximum Theorem, Rolle's Theorem, Mean Value Theorem
28. Further Applications of the Mean Value Theorem, 201
Applications, L'Hospital's Rules, interchange of limit and derivative, Taylor's Theorem
29. The Riemann-Stieltjes Integral, 212
Riemann-Stieltjes sums and the integral, Cauchy Criterion for Integrability, properties of the integral, integration by parts, modification of the integral
30. Existence of the Integral, 227
Riemann Criterion for Integrability, the integrability of continuous functions, Mean Value Theorems, Differentiation Theorem, Fundamental Theorem of Integral Calculus, Change of Variable Theorem
31. Further Properties of the Integral, 240
Interchange of limit and integral, Bounded Convergence Theorem, Monotone Convergence Theorem, integral form of the remainder, integrals depending on a parameter, Leibniz's formula, Interchange Theorem, Riesz Representation Theorem
32. Improper and Infinite Integrals, 257
Improper integrals of unbounded functions, infinite integrals, Cauchy Criterion, Comparison Test, Limit Comparison Test, Dirichlet's Test, absolute convergence
33. Uniform Convergence and Infinite Integrals, 267
Cauchy Criterion for uniform convergence, Weierstrass M-Test, Dirichlet's Test, infinite integrals depending on a parameter, Dominated Convergence Theorem, iterated infinite integrals

VI. Infinite Series 286

34. Convergence of Infinite Series, 286
Convergence of series, Cauchy Criterion, absolute convergence, Rearrangement Theorem

- 35. Tests for Absolute Convergence, 294
Comparison Test, Limit Comparison Test, Root Test, Ratio Test, Raabe's Test, Integral Test
- 36. Further Results for Series, 305
Abel's Lemma, Dirichlet's Test, Abel's Test, Alternating Series Test, double series, Cauchy multiplication
- 37. Series of Functions, 315
Absolute and uniform convergence, Cauchy Criterion, Weierstrass M -Test, Dirichlet's Test, Abel's Test, power series, Cauchy-Hadamard Theorem, Differentiation Theorem, Uniqueness Theorem, Multiplication Theorem, Bernstein's Theorem, Abel's Theorem, Tauber's Theorem
- 38. Fourier Series, 330
Bessel's Inequality, Riemann-Lebesgue Lemma, Pointwise Convergence Theorem, Uniform Convergence Theorem, Norm Convergence Theorem, Parseval's Equality, Fejér's Theorem, Weierstrass Approximation Theorem

VII. Differentiation in \mathbf{R}^p 346

- 39. The Derivative in \mathbf{R}^p , 347
Partial derivatives, directional derivatives, the derivative of $f: \mathbf{R}^p \rightarrow \mathbf{R}^q$, the Jacobian
- 40. The Chain Rule and Mean Value Theorems, 360
Chain Rule, Mean Value Theorem, interchange of the order of differentiation, higher derivatives, Taylor's Theorem
- 41. Mapping Theorems and Implicit Functions, 375
Class C^1 , Approximation Lemma, Injective Mapping Theorem, Surjective Mapping Theorem, Open Mapping Theorem, Inversion Theorem, Implicit Function Theorem, Parametrization Theorem, Rank Theorem
- 42. Extremum Problems, 397
Relative extrema, Second Derivative Test, extremum problems with constraints, Lagrange's Theorem, inequality constraints

VIII. Integration in \mathbf{R}^p 412

- 43. The Integral in \mathbf{R}^p , 412
Content zero, Riemann sums and the integral, Cauchy Criterion, properties of the integral, Integrability Theorem
- 44. Content and the Integral, 422
Sets with content, characterization of the content function, further properties of the integral, Mean Value Theorem, iterated integrals

45. Transformation of Sets and Integrals, 437

Images of sets with content under C^1 maps, transformations by linear maps, transformations by non-linear maps, the Jacobian Theorem, Change of Variables Theorem, polar and spherical coordinates, strong form of the Change of Variables Theorem
