

CONTENTS

INTRODUCTION: THEORY AND METHODS	1
Linear programming	1
The Simplex method	2
Dual Simplex method	4
Self-dual parametric algorithm	6
Multiple solutions	7
Bounded variables	9
The Inverse Matrix method	10
Decomposition	15
Parametric linear programming	18
Fourier–Motzkin method	20
Theorem of Farkas	20
Duality	21
The Primal-dual algorithm	23
Sensitivity analysis	24
The Transportation Problem	25
Relation with the Simplex method	30
The Ford–Fulkerson method	31
Capacity restrictions	33
The assignment problem	37
Theory of games	38
Network flow: optimization	40
Dual network	42
Shortest path	43
Critical path	44
Trees	45
Integer linear programming	45
Mixed integer programming	47
Branch-and-bound methods	48
The travelling salesman problem	50
A combinatorial problem	52
Quadratic programming	53
Dynamic programming	56
Fractional programming	57
Probabilistic programming	59

CONTENTS

PART I: LINEAR PROGRAMMING	63
Section 1 Simplex and Dual Simplex methods	63
2 (i) Primal-dual algorithm	71
(ii) Decomposition algorithm	72
(iii) Parametric problems	73
3 Applications	76
4 Linear programming theory	83
Solutions to Part I	85
PART II: OTHER LINEAR PROBLEMS	131
Section 1 Transportation problems	131
2 (i) Trans-shipment	137
(ii) Capacity limitations	139
(iii) Assignment problems	142
3 Theory of games	144
4 Optimization on networks	148
Solutions to Part II	151
PART III: NONLINEAR PROBLEMS	187
Section 1 (i) Integer programming	187
(ii) Branch-and-bound methods	191
2 Quadratic programming	194
3 Dynamic programming	197
4 Probabilistic programming	199
5 (i) Fractional programming	201
(ii) Miscellaneous problems	203
Solutions to Part III	205
