Preface	xi
Author	xiii
1 Bayesian Methods for Complex Data: Estimation and Inference	1
1.1 Introduction	1
1.2 Posterior Inference from Bayes Formula	3
1.3 Markov Chain Monte Carlo Sampling in Relation to Monte Carlo Methods: Obtaining Posterior Inferences	4
1.4 Hierarchical Bayes Applications	6
1.5 Metropolis Sampling	9
1.6 Choice of Proposal Density	11
1.7 Obtaining Full Conditional Densities	12
1.8 Metropolis–Hastings Sampling	15
1.9 Gibbs Sampling	19
1.10 Assessing Efficiency and Convergence: Ways of Improving Convergence	20
1.10.1 Hierarchical model parameterization to improve convergence	23
1.10.2 Multiple chain methods	24
1.11 Choice of Prior Density	26
1.11.1 Including evidence	27
1.11.2 Assessing posterior sensitivity: Robust priors	28
1.11.3 Problems in prior selection in hierarchical Bayes models	31
Appendix: Computational Notes	34
2 Model Fit, Comparison, and Checking	43
2.1 Introduction	43
2.2 Formal Methods: Approximating Marginal Likelihoods	45
2.2.1 Importance and bridge sampling estimates	47
2.2.2 Path sampling	49
2.2.3 Marginal likelihood for hierarchical models	50
2.3 Effective Model Dimension and Deviance Information Criterion	54
2.4 Variance Component Choice and Model Averaging	60

2.5	Predictive Methods for Model Choice and Checking	67
2.5.1	Bayesian predictive model checking and choice	67
	Bayesian predictive model checks	70
	Bayesian predictive checks	72
2.6	Estimating Posterior Model Probabilities	76
2.6.1	Random effects models	80
	Appendix: Computational Notes	81
3	Hierarchical Estimation for Exchangeable Units: Continuous and Discrete Mixture Approaches	89
3.1	Introduction	89
3.2	Hierarchical Priors for Ensemble Estimation using Continuous Mixtures	91
3.3	The Normal-Normal Hierarchical Model and Its Applications	93
3.4	Prior for Second Stage Variance	97
3.4.1	Nonconjugate priors	99
3.5	Multivariate Meta-Analysis	100
3.6	Heterogeneity in Count Data: Hierarchical Poisson Models	104
3.6.1	Nonconjugate Poisson mixing	107
3.7	Binomial and Multinomial Heterogeneity	109
3.7.1	Nonconjugate priors for binomial mixing	111
3.7.2	Multinomial mixtures	113
3.7.3	Ecological inference using mixture models	114
3.8	Discrete Mixtures and Nonparametric Smoothing Methods	116
3.8.1	Finite mixtures of parametric densities	117
3.8.2	Finite mixtures of standard densities	118
3.8.3	Inference in mixture models	119
3.8.4	Particular types of discrete mixture model	121
3.8.5	The logistic-normal alternative to the Dirichlet prior	123
3.9	Nonparametric Mixing via Dirichlet Process and Polya Tree Priors	124
3.9.1	Specifying the baseline density	127
3.9.2	Truncated Dirichlet processes and stick-breaking priors	128
3.9.3	Polya Tree priors	129
	Appendix: Computational Notes	133
4	Structured Priors Recognizing Similarity over Time and Space	141
4.1	Introduction	141
4.2	Modeling Temporal Structure: Autoregressive Models	144

4.2.1	Random coefficient autoregressive models	145
4.2.2	Low order autoregressive models	146
4.2.3	Antependence models	148
4.3	State–Space Priors for Metric Data	149
4.3.1	Simple signal models	150
4.3.2	Sampling schemes	152
4.3.3	Basic structural model	154
4.3.4	Identification questions	155
4.4	Time Series for Discrete Responses: State–Space Priors and Alternatives	160
4.4.1	Other approaches	163
4.5	Stochastic Variances	167
4.6	Modeling Discontinuities in Time	171
4.7	Spatial Smoothing and Prediction for Area Data	176
4.8	Conditional Autoregressive Priors	179
4.8.1	Linking conditional and joint specifications	180
4.8.2	Alternative conditional priors	181
4.8.3	ICAR(1) and convolution priors	183
4.9	Priors on Variances in Conditional Spatial Models	185
4.10	Spatial Discontinuity and Robust Smoothing	187
4.11	Models for Point Processes	192
4.11.1	Discrete convolution models	195
	Appendix: Computational Notes	200
5	Regression Techniques Using Hierarchical Priors	207
5.1	Introduction	207
5.2	Regression for Overdispersed Discrete Data	209
5.2.1	Overdispersed binomial and multinomial regression	211
5.3	Latent Scales for Binary and Categorical Data	215
5.3.1	Augmentation for ordinal responses	219
5.4	Nonconstant Regression Relationships and Variance Heterogeneity	221
5.5	Heterogenous Regression and Discrete Mixture Regressions	222
5.5.1	Discrete mixture regressions	223
5.5.2	Zero-inflated mixture regression	226
5.6	Time Series Regression: Correlated Errors and Time-Varying Regression Effects	231
5.7	Time-Varying Regression Effects	234
5.8	Spatial Correlation in Regression Residuals	240
5.8.1	Spatial lag and spatial error models	241
5.9	Spatially Varying Regression Effects: Geographically Weighted Linear Regression and Bayesian Spatially Varying Coefficient Models	244

5.9.1	Bayesian spatially varying coefficient models	246
	Appendix: Computational Notes	250
6	Bayesian Multilevel Models	257
6.1	Introduction	257
6.2	The Normal Linear Mixed Model for Hierarchical Data . . .	258
6.2.1	The Lindley–Smith model format	261
6.3	Discrete Responses: General Linear Mixed Model, Conjugate, and Augmented Data Models	262
6.3.1	Augmented data multilevel models	264
6.3.2	Conjugate cluster effects	265
6.4	Crossed and Multiple Membership Random Effects	270
6.5	Robust Multilevel Models	273
	Appendix: Computational Notes	277
7	Multivariate Priors, with a Focus on Factor and Structural Equation Models	281
7.1	Introduction	281
7.2	The Normal Linear SEM and Factor Models	283
7.2.1	Forms of model	284
7.2.2	Marginal and complete data likelihoods, and Markov Chain Monte Carlo sampling	285
7.3	Identifiability and Priors on Loadings	287
7.3.1	An illustration of identifiability issues	289
7.4	Multivariate Exponential Family Outcomes and General Linear Factor Models	292
7.4.1	Multivariate Poisson data	293
7.4.2	Multivariate binary data and item response models . .	295
7.4.3	Latent scale binary models	297
7.4.4	Categorical data	298
7.5	Robust Options in Multivariate and Factor Analysis	303
7.5.1	Discrete mixture multivariate models	303
7.5.2	Discrete mixtures in SEM and factor models	304
7.5.3	Robust density assumptions in factor models	307
7.6	Multivariate Spatial Priors for Discrete Area Frameworks . .	311
7.7	Spatial Factor Models	315
7.8	Multivariate Time Series	318
7.8.1	Multivariate dynamic linear models	319
7.8.2	Dynamic factor analysis	321
7.8.3	Multivariate stochastic volatility	323
	Appendix: Computational Notes	332
8	Hierarchical Models for Panel Data	337
8.1	Introduction	337

8.2	General Linear Mixed Models for Panel Data	338
8.2.1	Centered or noncentered priors	341
8.2.2	Priors on permanent random effects	343
8.2.3	Priors for random covariance matrix and random effect selection	345
8.2.4	Priors for multiple sources of error variation	348
8.3	Temporal Correlation and Autocorrelated Residuals	351
8.3.1	Explicit temporal schemes for errors	352
8.4	Panel Categorical Choice Data	357
8.5	Observation-Driven Autocorrelation: Dynamic Panel Models	362
8.5.1	Dynamic panel models for discrete data	364
8.6	Robust Panel Models: Heteroscedasticity, Generalized Error Densities, and Discrete Mixtures	370
8.6.1	Robust panel data models: discrete mixture models	373
8.7	Multilevel, Multivariate, and Multiple Time Scale Longitudinal Data	380
8.7.1	Latent trait longitudinal models	384
8.7.2	Multiple scale panel data	386
8.8	Missing Data in Panel Models	393
8.8.1	Forms of missingness regression (selection approach)	396
8.8.2	Common factor models	397
8.8.3	Missing predictor data	399
8.8.4	Pattern mixture models	401
	Appendix: Computational Notes	406
9	Survival and Event History Models	413
9.1	Introduction	413
9.2	Survival Analysis in Continuous Time	414
9.2.1	Counting process functions	416
9.2.2	Parametric hazards	417
9.2.3	Accelerated hazards	419
9.3	Semi-Parametric Hazards	423
9.3.1	Cumulative hazard specifications	425
9.4	Including Frailty	428
9.4.1	Cure rate models	430
9.5	Discrete Time Hazard Models	435
9.5.1	Life tables	437
9.6	Dependent Survival Times: Multivariate and Nested Survival Times	441
9.7	Competing Risks	447
9.7.1	Modeling frailty	449

Appendix: Computational Notes	451
10 Hierarchical Methods for Nonlinear Regression	459
10.1 Introduction	459
10.2 Nonparametric Basis Function Models for the Regression Mean	460
10.2.1 Mixed model splines	462
10.2.2 Model selection	464
10.2.3 Basis functions other than truncated polynomials	465
10.3 Multivariate Basis Function Regression	468
10.4 Heteroscedasticity via Adaptive Nonparametric Regression	476
10.5 General Additive Methods	479
10.6 Nonparametric Regression Methods for Longitudinal Analysis	483
Appendix: Computational Notes	491
Appendix 1: Using WinBUGS and BayesX	495
A1.1 WinBUGS: Compiling, Initializing, and Running Programs	495
A1.2 WinBUGS Steps in Program Checking and Execution	495
A1.3 Using BayesX	498
References	501
Index	565
