Preface	vii
1. Introduction to curve estimation	1
1.1 Example: Model identification	1
1.2 Example: Mixture decomposition	5
1.3 Example: Regression	10
1.4 Outline of topics	13
2. Generalized representation	17
2.1 The problem of specification	17
2.2 History of generalized representation	22
2.3 From representation to curve estimation	28
2.4 The method of moments	32
3. Series and kernel-based density estimation	36
3.1 Initial choices	36
3.2 Fourier series density estimation	39
3.3 Kernel density estimation	49
4. Optimizing density estimates	61
4.1 Preliminary considerations	62
4.2 Single-term stopping rule	64
4.3 Diggle and Hall stopping rule	70
4.4 Hart stopping rule	73
4.5 Fellner multiplier sequence	74
4.6 Estimated Watson multipliers	78
4.7 The weighted MISE	80
4.8 Transformations and the weighted MISE	83
4.9 Weighted multiplier sequences	87
5. Mixture decomposition applications	91
5.1 Mixtures and multipliers	91
5.2 Approaches to mixture decomposition	96
5.3 Fejér multipliers as intermediates between Dirichlet and lambda multipliers	99
5.4 Lambda multipliers	106
5.5 The lambda KT used for $\bar{\sigma}^2$ reduction	110

5.6	Generalizations and limitations of lambda methodology	114
6.	Curve estimation approaches to model and transformation selection	121
6.1	Parameters, properties, and multipliers	126
6.2	Coefficients as properties and parameters	131
6.3	Curves and multiple parameters	132
6.4	An example of the simultaneous selection of a model and a transformation	134
7.	Threshold parameter and transformation applications	137
7.1	The $R(x)$ function and skewness	144
7.2	The specifics of model, logmodel and fractional power model selection	146
7.3	Extended model & general curve estimator complexity	149
7.4	Specific elementary function choices of G	150
7.5	$R(x)$ and modularity	156
7.6	$R(y x)$ curves	158
7.7	Truncation adjustments	161
8.	Applications of likelihood multipliers	167
8.1	Likelihood multiplier LAV and other types of regression	170
8.2	Series representation of the likelihood function	185
8.3	Multiplier system independence	187
8.4	Sheppard's correction and the lambda method	189
8.5	Correction for grouping	191
8.6	The Pearson and Poisson families	194
8.7	The Neyman discrete variate test	208
8.8	Discrete variates and logistic regression	209
9.	Survival curve and bivariate estimation applications	212
9.1	Likelihood in the generalized case	216
9.2	Survival curve applications: The stationary case	218
9.3	Survival curve applications: The nonstationary case	223
9.4	Bivariate model and transformation selection	227
9.5	Likelihood ratio tests	233
10.	Nonparametric curve estimation and inference	236
10.1	Nonparametric inference and curve estimation	239
10.2	The hybrid Wilcoxon test and the logistic model	243
10.3	Bayesian inference and curve estimation	252
10.4	The Watson A-test and its generalizations	256
