

# CONTENTS

Preface to the Classics Edition	xi
Preface	xiii
<b>1 LINEAR DIFFERENTIAL EQUATIONS</b>	
1. Linear Independence and Linear Mappings	1
2. Uniqueness of Solutions Given the State: Linearization	11
3. The Transition Matrix	19
4. Three Properties of $\Phi$	27
5. Matrix Exponentials	31
6. Inhomogeneous Linear Equations	39
7. Adjoint Equations	43
8. Periodic Homogeneous Equations: Reducibility	46
9. Periodic Inhomogeneous Equations	50
10. Some Basic Results of Asymptotic Behavior	54
11. Linear Matrix Equations	58
<b>2 LINEAR SYSTEMS</b>	
12. Structure of Linear Mappings	67
13. Controllability	74
14. Observability	86
15. Weighting Patterns and Minimal Realizations	91
16. Stationary Weighting Patterns: Frequency Response	98
17. Realization Theory for Time-Invariant Systems	107
18. McMillan Degree	111
19. Feedback	116
<b>3 LEAST SQUARES THEORY</b>	
20. Minimization in Inner Product Spaces	124
21. Free End-Point Problems	130
22. Fixed End-Point Problems	136
23. Time-Invariant Problems	147
24. Canonical Equations, Conjugate Points, and Focal Points	155
25. Frequency Response Inequalities	164
26. Scalar Control: Spectral Factorization	169
27. Spectral Factorization and $A'K + KA - Kbb'K = -c'c$	177
	ix

**4 STABILITY**

28. Normed Vector Spaces and Inequalities	183
29. Uniform Stability and Exponential Stability	188
30. Input–Output Stability	194
31. Liapunov’s Direct Method	199
32. Some Perturbational Results	205
33. Frequency Domain Stability Criteria	210
34. Nyquist Criterion: Positive Real Functions	214
35. The Circle Criterion	218
<b>REFERENCES</b>	228
<b>GLOSSARY OF NOTATION</b>	235
<b>INDEX</b>	239
