

CONTENTS

<i>Foreword</i>	11
<i>Acknowledgements</i>	13
SECTION I. THE THEORY	15
1. Hospitalization: Time Without Purpose	17
Hospitalized patients experience the loss of behaviors they have known all their lives because the hospital does not make available the necessary behavior settings in which to perform them. This is a severe personal, social, and psychological loss.	
2. Us And Them: Only The Aged Know	27
A discussion of the quality of existence in the experience of daily life for aged, institutionalized populations offers a reconception of the nursing home environment.	

3. Archetypal Place 35

A general theory with which to integrate human needs, design, and evaluation efforts is presented here. The same schema may also inform treatment program design.

4. Archetypal Place And The Needs Of The Aging 53

with Lorraine Snyder

The developing environmental needs of aging populations are discussed in terms of insights available through an understanding of Archetypal Place theory.

5. The Exceptional Environment: Strategies For Design 65

This chapter details the author's approach to institutional design with examples which show how patient (use) behavior may come to inform design solutions.

SECTION II. THE INVESTIGATIONS 83

6. Mental Health Center Architecture: Psychological Implications And Sensory Distortions 85

This chapter examines the peculiar environmental configurations which have evolved in this genre, with a discussion of their psychological and sensory effects upon patients.

**7. Behavior Patterns Related to
Spatially Differentiated Areas of a
Psychiatric Ward Dayroom 117**

with Melvin Barton and David Mishkin

This report investigates the relationships of patient behavior patterns to a typical traditional psychiatric dayroom.

**8. The Effect of Angle of Light on the
Recognition and
Evaluation of Faces 129**

with Melvin Barton and Peter Powell

The quality of illumination in psychiatric and other hospital environments mediates visual nonverbal communication. These effects and visual preferences are explored in this chapter.

**9. Ratings of Eexperiental Play and
Learning Settings for
Emotionally Disturbed and
Mentally Retarded Children 141**

with Melvin Barton and David Mishkin

This experiment was conducted to determine the equipment, environments, and settings which would involve and interest emotionally disturbed and mentally retarded children in their environment and each other.

SECTION III. THE APPLICATION 151

10. The Tool Kit 153

	11. You, the Sensor	163
	12. Diagnosing the Environment	167
	13. Getting Started: Strategies	173
	14. Lighting and Vision	185
	15. Olfaction	197
	This section presents an informally written tool kit for increasing sensitivity to environmental conditions, and for initiating programs and procedures for the improvement of any environment.	
SECTION IV.	PROGRAMMING AND EVALUATION	201
	16. The Design Log Method	203
	The Design Log Method is a systematic approach to architectural design which integrates programming, user-need consultation, and design evaluation.	
SECTION V	A MODEL	223
	17. Mental Health Facilities: A Model For Physical Planning	225
	<i>with Harold W. Demone, Jr.</i>	
	A rational and complete discussion of the process and content of mental health facility planning, design, and evaluation.
