<b>1</b>	<b>Classical mechanics</b>	<b>1</b>
1.1	Introduction	1
1.2	Newton's laws of motion	1
1.3	Phase space: visualizing classical motion	5
1.4	Lagrangian formulation of classical mechanics: A general framework for Newton's laws	10
1.5	Legendre transforms	16
1.6	Generalized momenta and the Hamiltonian formulation of classical mechanics	18
1.7	A simple classical polymer model	25
1.8	The action integral	29
1.9	Lagrangian mechanics and systems with constraints	32
1.10	Gauss's principle of least constraint	35
1.11	Rigid body motion: Euler angles and quaternions	37
1.12	Non-Hamiltonian systems	47
1.13	Problems	50
<b>2</b>	<b>Theoretical foundations of classical statistical mechanics</b>	<b>54</b>
2.1	Overview	54
2.2	The laws of thermodynamics	56
2.3	The ensemble concept	62
2.4	Phase space volumes and Liouville's theorem	64
2.5	The ensemble distribution function and the Liouville equation	66
2.6	Equilibrium solutions of the Liouville equation	70
2.7	Problems	71
<b>3</b>	<b>The microcanonical ensemble and introduction to molecular dynamics</b>	<b>75</b>
3.1	Brief overview	75
3.2	Basic thermodynamics, Boltzmann's relation, and the partition function of the microcanonical ensemble	76
3.3	The classical virial theorem	81
3.4	Conditions for thermal equilibrium	84
3.5	The free particle and the ideal gas	87
3.6	The harmonic oscillator and harmonic baths	93
3.7	Introduction to molecular dynamics	96
3.8	Integrating the equations of motion: Finite difference methods	99
3.9	Systems subject to holonomic constraints	104
3.10	The classical time evolution operator and numerical integrators	108
3.11	Multiple time-scale integration	115

3.12	Symplectic integration for quaternions	119
3.13	Exactly conserved time step dependent Hamiltonians	121
3.14	Illustrative examples of molecular dynamics calculations	124
3.15	Problems	130
<b>4</b>	<b>The canonical ensemble</b>	<b>135</b>
4.1	Introduction: A different set of experimental conditions	135
4.2	Thermodynamics of the canonical ensemble	136
4.3	The canonical phase space distribution and partition function	137
4.4	Energy fluctuations in the canonical ensemble	142
4.5	Simple examples in the canonical ensemble	144
4.6	Structure and thermodynamics in real gases and liquids from spatial distribution functions	153
4.7	Perturbation theory and the van der Waals equation	169
4.8	Molecular dynamics in the canonical ensemble: Hamiltonian formulation in an extended phase space	179
4.9	Classical non-Hamiltonian statistical mechanics	185
4.10	Nosé–Hoover chains	192
4.11	Integrating the Nosé–Hoover chain equations	197
4.12	The isokinetic ensemble: A simple variant of the canonical ensemble	202
4.13	Applying canonical molecular dynamics: Liquid structure	207
4.14	Problems	208
<b>5</b>	<b>The isobaric ensembles</b>	<b>218</b>
5.1	Why constant pressure?	218
5.2	Thermodynamics of isobaric ensembles	219
5.3	Isobaric phase space distributions and partition functions	220
5.4	Pressure and work virial theorems	226
5.5	An ideal gas in the isothermal-isobaric ensemble	228
5.6	Extending the isothermal-isobaric ensemble: Anisotropic cell fluctuations	229
5.7	Derivation of the pressure tensor estimator from the canonical partition function	233
5.8	Molecular dynamics in the isoenthalpic-isobaric ensemble	237
5.9	Molecular dynamics in the isothermal-isobaric ensemble I: Isotropic volume fluctuations	240
5.10	Molecular dynamics in the isothermal-isobaric ensemble II: Anisotropic cell fluctuations	243
5.11	Atomic and molecular virials	247
5.12	Integrating the MTK equations of motion	249
5.13	The isothermal-isobaric ensemble with constraints: The ROLL algorithm	256
5.14	Problems	261
<b>6</b>	<b>The grand canonical ensemble</b>	<b>265</b>
6.1	Introduction: The need for yet another ensemble	265

6.2	Euler's theorem	265
6.3	Thermodynamics of the grand canonical ensemble	267
6.4	Grand canonical phase space and the partition function	268
6.5	Illustration of the grand canonical ensemble: The ideal gas	274
6.6	Particle number fluctuations in the grand canonical ensemble	275
6.7	Problems	278
<b>7</b>	<b>Monte Carlo</b>	<b>280</b>
7.1	Introduction to the Monte Carlo method	280
7.2	The Central Limit theorem	281
7.3	Sampling distributions	285
7.4	Hybrid Monte Carlo	297
7.5	Replica exchange Monte Carlo	300
7.6	Wang–Landau sampling	304
7.7	Transition path sampling and the transition path ensemble	305
7.8	Problems	312
<b>8</b>	<b>Free energy calculations</b>	<b>315</b>
8.1	Free energy perturbation theory	315
8.2	Adiabatic switching and thermodynamic integration	318
8.3	Adiabatic free energy dynamics	322
8.4	Jarzynski's equality and nonequilibrium methods	325
8.5	The problem of rare events	333
8.6	Reaction coordinates	334
8.7	The blue moon ensemble approach	336
8.8	Umbrella sampling and weighted histogram methods	343
8.9	Wang–Landau sampling	347
8.10	Adiabatic dynamics	348
8.11	Metadynamics	355
8.12	The committor distribution and the histogram test	359
8.13	Problems	361
<b>9</b>	<b>Quantum mechanics</b>	<b>365</b>
9.1	Introduction: Waves and particles	365
9.2	Review of the fundamental postulates of quantum mechanics	367
9.3	Simple examples	380
9.4	Identical particles in quantum mechanics: Spin statistics	387
9.5	Problems	390
<b>10</b>	<b>Quantum ensembles and the density matrix</b>	<b>395</b>
10.1	The difficulty of many-body quantum mechanics	395
10.2	The ensemble density matrix	396
10.3	Time evolution of the density matrix	399
10.4	Quantum equilibrium ensembles	400
10.5	Problems	405
<b>11</b>	<b>The quantum ideal gases: Fermi–Dirac and Bose–Einstein statistics</b>	<b>409</b>

11.1	Complexity without interactions	409
11.2	General formulation of the quantum-mechanical ideal gas	409
11.3	An ideal gas of distinguishable quantum particles	413
11.4	General formulation for fermions and bosons	415
11.5	The ideal fermion gas	417
11.6	The ideal boson gas	432
11.7	Problems	442
<b>12</b>	<b>The Feynman path integral</b>	<b>446</b>
12.1	Quantum mechanics as a sum over paths	446
12.2	Derivation of path integrals for the canonical density matrix and the time evolution operator	450
12.3	Thermodynamics and expectation values from the path integral	457
12.4	The continuous limit: Functional integrals	462
12.5	Many-body path integrals	471
12.6	Numerical evaluation of path integrals	475
12.7	Problems	492
<b>13</b>	<b>Classical time-dependent statistical mechanics</b>	<b>495</b>
13.1	Ensembles of driven systems	495
13.2	Driven systems and linear response theory	497
13.3	Applying linear response theory: Green–Kubo relations for transport coefficients	504
13.4	Calculating time correlation functions from molecular dynamics	512
13.5	The nonequilibrium molecular dynamics approach	517
13.6	Problems	527
<b>14</b>	<b>Quantum time-dependent statistical mechanics</b>	<b>530</b>
14.1	Time-dependent systems in quantum mechanics	530
14.2	Time-dependent perturbation theory in quantum mechanics	534
14.3	Time correlation functions and frequency spectra	544
14.4	Examples of frequency spectra	548
14.5	Quantum linear response theory	551
14.6	Approximations to quantum time correlation functions	557
14.7	Problems	568
<b>15</b>	<b>The Langevin and generalized Langevin equations</b>	<b>572</b>
15.1	The general model of a system plus a bath	572
15.2	Derivation of the generalized Langevin equation	575
15.3	Analytically solvable examples based on the GLE	583
15.4	Vibrational dephasing and energy relaxation in simple fluids	588
15.5	Molecular dynamics with the Langevin equation	591
15.6	Sampling stochastic transition paths	596
15.7	Mori–Zwanzig theory	598
15.8	Problems	604
<b>16</b>	<b>Critical phenomena</b>	<b>609</b>
16.1	Phase transitions and critical points	609

16.2	The critical exponents $\alpha$ , $\beta$ , $\gamma$ , and $\delta$	611
16.3	Magnetic systems and the Ising model	612
16.4	Universality classes	616
16.5	Mean-field theory	618
16.6	Ising model in one dimension	624
16.7	Ising model in two dimensions	626
16.8	Spin correlations and their critical exponents	633
16.9	Introduction to the renormalization group	634
16.10	Fixed points of the RG equations in greater than one dimension	641
16.11	General linearized RG theory	643
16.12	Understanding universality from the linearized RG theory	645
16.13	Problems	647
<b>Appendix A</b>	<b>Properties of the Dirac delta-function</b>	<b>653</b>
<b>Appendix B</b>	<b>Evaluation of energies and forces</b>	<b>656</b>
<b>Appendix C</b>	<b>Proof of the Trotter theorem</b>	<b>667</b>
<b>Appendix D</b>	<b>Laplace transforms</b>	<b>670</b>
