INTRODUCTION	1
Towards constructing a theory of urban evolution	1
A note on models	3
The structure of the book	5
Some definitions	6
Part I. NON-LINEAR DYNAMICAL ANALYSIS AND STABILITY	9
A. Introduction	9
B. Selected systems of differential equations	12
1. The Volterra-Lotka system	14
2. Bifurcation	16
3. The Van der Pol equation and the Hopf bifurcation	18
4. The May-Li-Yorke chaos	20
5. Structural stability and elementary catastrophe theory	23
C. Conclusions	24
Part II. URBAN ECOLOGY: INTER-URBAN DYNAMICS	27
A. Introduction	27
B. Equivalences between general ecology and urban ecology: towards a 'new urban ecological' theory	30
C. Inter-urban mathematical ecology	37
1. Single-city aggregate dynamics; no reward function	37
2. Economics of single-city dynamics with reward function	39
3. The basic urban ecological model	42
4. Price-quantity functions and the Volterra-Lotka formalism	44

D.	Inter-urban landscapes	45
1.	A landscape of various urban geographies	45
2.	The urban Volterra–Lotka model and urban economic landscapes	49
E.	Empirical findings: urban dynamic patterns	54
1.	Overview	54
2.	Apparent and proper motion in aggregate urban dynamics	62
3.	Urban perturbations	64
4.	The urban carrying capacity and the effective environment of cities	67
5.	Period of motion and summary	70
F.	Multiple cities interaction: urban complexity and stability	70
1.	Urban ecosystems with random interaction; the May theorem	71
2.	Multiple populations urban models; some results from Volterra	76
3.	<i>N</i> -species ecology and dynamics of general equilibrium in economics	78
G.	Dynamic stability of aggregate urban capital accumulation	80
1.	Capital formation in the urban ecological model	80
2.	The May chaos in the neo-classical capital formation theory	84
H.	Urban ecological diversity	85
1.	The entropy of an urban hierarchy	85
2.	An alternative to central place theory urban nesting system	88
3.	Evolution of the urban hierarchy	90
I.	Optimum urban ecology	91
J.	Conclusions	92
Part III.	URBAN ECOLOGY: INTRA-URBAN DYNAMICS	95
A.	Introduction	95
B.	Intra-urban ecology and form	96

C.	Intra-zonal ecology: non-linear dynamic competition for space	100
1.	The two-activities city; mixed land use equilibria	100
2.	Neighbourhood tipping and gentrification	105
3.	Vacant land zones and threshold in initial capital investment	109
4.	Multiple land use equilibria	110
D.	Inter-zonal ecology: non-linear dynamic competition for urban activity	111
1.	The phenomena of suburbanization and centralization	111
2.	Slum formation and historical preservation	112
E.	Summary and general remarks on intra-urban predatory dynamics	114
F.	Intra-urban instability, disaggregation, and high interconnectance	115
G.	Intra-urban prediction, parsimony, and policy analysis	118
H.	Stochasticity and determinism in intra-urban dynamics	120
1.	Land rent, density, and oscillatory dynamics in land use	120
2.	The stochastic master equation for rent-density interactions	123
3.	Empirical testing of the land use density-rent model	125
I.	Conclusions	128
Part IV.	EPISTEMOLOGICAL ASPECTS OF URBAN EVOLUTION	131
A.	Introduction: the process of selection	131
B.	Selection in urban ecology	132
1.	Survival of urban communities	132
2.	Selection in the urban landscape	134
C.	Selection as an optimization process: environmental adjustment and adaptation	134

xvi *Contents*

D. Selection, complexity, and stability	138
E. Selection and innovation in urban evolution	139
F. Urban determinism, necessity, chance, and prediction	141
EPILOGUE: Some thoughts on the interconnectance of natural and urban sciences and the mathematical formalism	145
APPENDIX I-IX	149
