

Dipl.-Ing. Sabine Maria Schlögl, Leoben

**Micromechanical
Modelling of the
Deformation Behaviour
of Gamma Titanium
Aluminides**

Reihe **18**: Mechanik/
Bruchmechanik

Nr. **220**

Contents

1	Introduction	1
1.1	General introduction to intermetallic titanium aluminides	1
1.2	Microstructure and mechanical properties of γ -TiAl based alloys	4
1.3	Outline	5
1.4	Notation	6
2	Deformation mechanisms and their continuum mechanical description	7
2.1	Crystallographic slip	8
2.2	Deformation twinning	11
3	Modelling of the mechanical properties of the lamellar microstructure	15
3.1	Introduction to PST crystals of TiAl	15
3.2	Micromechanical model for PST crystals of TiAl	19
3.3	Simulation of uniaxial tests for PST crystals	25
3.3.1	Flow stress behaviour	25
3.3.2	Influence of α_2 -Ti ₃ Al on the local stress distribution	30
3.3.3	Influence of the critical shear stress for twinning on the yield strength of PST crystals	35
3.4	Simulation of tensile tests of polycrystalline lamellar titanium aluminides	39
3.4.1	Single lamellar grain as input data	39
3.4.2	Geometry of lamellar polycrystals	40
3.4.3	Results and discussion	44
3.5	Simulation of the response of PST crystals under biaxial loading	47
3.5.1	Introduction to the yield locus	47
3.5.2	Computed yield loci	48
3.5.3	Comparison of the computed yield loci with common yield criteria	56

4	Modelling of the mechanical properties of the near gamma microstructure	62
4.1	Micromechanical model for the near gamma microstructure	62
4.2	Influence of the superdislocations on the flow stress behaviour	64
4.3	Influence of a texture on yielding	66
4.4	Comparison of the simulation with TEM investigations	68
5	Concluding remarks	75
6	Appendices	77
6.1	Input file for the subroutine UMATCRSPL	77
6.2	Slip systems in α_2 -Ti ₃ Al	80
6.3	Euler angles for the near gamma microstructure	81
	Bibliography	83
