PREFACE	xi
CHAPTER 1. HISTORICAL INTRODUCTION	I
A. Early work on heterogeneous catalytic oxidation	I
B. Early hypotheses on the mode of action of catalysts	4
C. The catalytic synthesis of ammonia	7
D. The catalysis of organic reactions by metals	8
References	10
CHAPTER 2. THE DEVELOPMENT OF MODERN IDEAS	11
A. Early work of Langmuir on catalytic reactions and adsorption	11
1. Formation of atomic hydrogen by dissociation of molecular hydrogen on incandescent tungsten filaments	11
2. Adsorption isotherms	12
(a) Adsorption of molecules without dissociation on crystal surfaces	12
(b) Adsorption with dissociation on crystal surfaces	13
B. Kinetics of catalytic reactions	14
1. The diffusion theory of Nernst	14
2. The Langmuir–Hinshelwood mechanism	15
3. The absolute rate of heterogeneous gas reactions	17
4. The Rideal mechanism	18
5. The possibility of chain reactions at a catalytic surface	19
C. Active centres on catalytic surfaces	21
D. Catalysis and adsorption	25
1. The hypothesis of activated adsorption	27
2. The surface mobility of adsorbed layers	32
(a) Mobility and Langmuir–Hinshelwood kinetics	33
(b) Surface mobility of metal atoms induced by catalytic reactions and by adsorption of gases	34

	PAGE
E. Discussion of adsorption and desorption processes with the help of potential energy curves	37
1. Kinetics of desorption of ions and potential energy curves	41
(a) Comparison of calculated results for ionic desorption with experimental results obtained with a cleaned tungsten surface and a modulated molecular beam of impinging atoms	43
2. Transition state theory and desorption kinetics	49
3. Potential energy curves and endothermic adsorption	52
4. Potential energy curves and weak chemisorption	53
F. Ionisation and catalysis	55
G. The electronic factor in catalysis	57
H. The geometric factor in catalysis	60
1. Catalytic reactions on single crystal planes	62
References	64
 CHAPTER 3. THE USE OF ULTRA-HIGH VACUUM IN RESEARCH ON CATALYSIS BY METALS	 68
A. Pumping speed in vacuum systems	69
B. Ionisation gauges for measurement of low gas pressures	70
1. The Bayard-Alpert gauge	72
2. Other ion gauges for ultra-high vacuum	73
(a) The Helmer gauge	73
(b) The inverted magnetron gauge	74
C. The production of ultra-high vacuum in the laboratory	75
1. Special pumps for ultra-high vacuum systems	75
(a) Molecular sieve pumping	77
D. Analysis of residual gases in ultra-high vacuum systems	78
E. Examples of ultra-high vacuum apparatus used for research on the catalysis of gas reactions by metals	80
1. The static system used by R. W. Roberts	80
2. The flow system used by E. M. A. Willhoft	81
References	82
 CHAPTER 4. THE PREPARATION OF CLEAN METAL SURFACES	 84
A. Evaporation of metal on to a substrate	84
B. High temperature heating	86
C. Chemical reaction	86
D. Ion bombardment	86
E. Field desorption	87
F. Preparation of single-crystal metal surfaces	87
References	88

	PAGE
CHAPTER 5. THE NATURE AND PROPERTIES OF METAL SURFACES	89
A. The arrangement of atoms at an ideal surface	89
B. The investigation of the surfaces of metals by field ion microscopy	90
1. Field ionisation	90
2. The field ion microscope in practice	92
C. Terraces, steps, kinks, adatoms and vacancies at metal surfaces	94
D. Intersection of edge and screw dislocations with metal surfaces	95
E. Surfaces of real metals	97
F. The investigation of the structure of crystal surfaces by low-energy electron diffraction	97
1. The actual arrangement of atoms at metal crystal surfaces	98
References	99
CHAPTER 6. SUPPORTED METAL CATALYSTS	101
A. Preparation of supported catalysts	101
B. Determination of the surface area of metal in a supported metal catalyst	102
C. Influence of the nature of the support and of crystallite size on specific activity	103
References	105
CHAPTER 7. PHYSICAL METHODS FOR THE INVESTIGATION OF ADSORBED LAYERS ON METAL SURFACES	107
A. The thermal accommodation coefficient	107
B. Auger neutralisation and Auger de-excitation	109
C. Sticking probability	109
D. Flash desorption	110
E. Heats of adsorption	111
F. Surface potentials	112
G. Field emission	113
1. The Fowler-Nordheim equation	113
2. Field emission microscopy	114
3. Field emission work function measurements	115

	PAGE
H. Field ion microscopy	116
I. Low-energy electron diffraction	117
J. The infrared spectra of adsorbed gases	117
K. Electric and magnetic measurements	118
1. The electrical resistance of metal films	118
2. Ferromagnetism of small crystals	118
L. Ion and electron bombardment	119
References	119
 CHAPTER 8. THE INTERPRETATION OF THE KINETICS OF CATALYTIC REACTIONS IN TERMS OF ADSORBED LAYERS AND ADSORPTION ISOTHERMS	 122
A. Decomposition of a single reactant discussed in terms of the Langmuir isotherm	123
1. The probability of reaction at a single collision of a reactant molecule with the catalytic surface	124
B. Reactions involving two reactants	125
1. The power rate law in heterogeneous catalysis	126
C. The logarithmic (or Temkin) adsorption isotherm	126
D. The kinetics of the catalytic decomposition of ammonia	128
1. Kinetics of the decomposition of ammonia on platinum at low pressures	129
References	132
 CHAPTER 9. THE ABSOLUTE RATE OF CATALYTIC REACTIONS INVOLVING ONE AND TWO REACTANTS	 133
A. First-order decomposition of a single reactant	133
1. Immobile transition state	133
(a) Comparison with experiment	136
2. Mobile transition state	136
3. Symmetry number of the transition state	137
B. Evaporation of molecules formed by a collision of two mobile adsorbed atoms	137
C. Reactions involving two reactants	138
1. Adjacent interaction forming an immobile transition state	138
2. Two reactants forming a mobile transition state	139
3. Collision yield in a reaction involving two reactants	140
References	140

	PAGE
CHAPTER 10. THE POSSIBLE IMPORTANCE OF ACTIVE SITES IN CATALYSIS BY METALS	141
A. Some experimental investigations on active sites	141
1. Use of thin metal sheets as catalysts in an ultra-high vacuum system	141
(a) Hydrogenation of ethylene	141
(b) Hydrogen-deuterium exchange on nickel	142
2. The decomposition of formic acid on single crystal faces of silver	143
3. The decomposition of formic acid on silver films	143
B. The annealing of extra activity ascribed to active centres	144
C. Effects of pre-treatment of the wire on the decomposition of formic acid on nickel and platinum wires	144
1. Decomposition on nickel	145
2. Decomposition on platinum	147
D. Effects of ionising radiation on the catalytic activity of metals	148
E. Active sites in adsorption and in catalysis	149
References	149
CHAPTER 11. THE ELECTRONIC FACTOR IN CATALYSIS BY METALS	151
A. The importance of the compensation effect when catalytic activity is related to some property of the metal.	151
B. Holes in the d-band	152
1. Gibbs free energy per electron	154
2. Intermediates in catalysis and electron transfer	155
C. The resonating-valence-bond theory	156
D. More detailed considerations of the electronic factor and of surface bonding	157
1. The possible importance of π -bonded intermediates in metal-catalysed reactions	157
References	158
CHAPTER 12. DECOMPOSITION REACTIONS OF SOME GASES ON METAL CATALYSTS AT LOW PRESSURES	159
A. Investigations with field emission and field ionisation	159
B. Investigation of reactions in a time which is short compared with the time of monolayer formation	161
1. Use of flow systems	161
2. Use of static systems	161
C. Determination of collision yield in a flow system	162

	PAGE
D. Results of some reaction studies using flow methods	163
1. Some reactions on a platinum wire	163
2. Some reactions on a niobium wire	164
E. Influence of contamination of the surface on Arrhenius parameters	165
References	166
