PREFACE	xxvii
I. INTRODUCTION	1
1. CHANGES IN QUANTITATIVE TRAITS OVER TIME	3
A Brief History of the Study of the Evolution of Quantitative Traits	4
The fusion of population and quantitative genetics	4
The ongoing fusion of molecular and quantitative genetics	7
The common thread between breeding and evolution in natural populations	9
Detecting selection in natural populations	10
The Theoretical Foundations of Evolutionary Biology	11
The completeness of evolutionary theory	11
Nonadaptive hypotheses and our understanding of evolution	14
Overview and Pathways Through This Volume	16
Evolution at one and two loci	17
Drift and quantitative traits	18
Short-term response on a single character	18
Selection in structured populations	19
Population-genetic models of trait response	20
Measuring selection on traits	20
Appendices	21
Volume 3	21
Notation	22
II. EVOLUTION AT ONE AND TWO LOCI	23
2. NEUTRAL EVOLUTION IN ONE- AND TWO-LOCUS SYSTEMS	25
The Wright-Fisher Model	26
Loss of Heterozygosity by Random Genetic Drift	28
Probabilities and Times to Fixation or Loss	31
The age of a Neutral Allele	33
Allele-frequency Divergence Among Populations	35
Buri's Experiment	36
Higher-order Allele-frequency Moments	40
Linkage Disequilibrium	43
Mutation-drift Equilibrium	44
The Detailed Structure of Neutral Variation	48
The infinite-alleles model and the associated allele-frequency spectrum	48
The infinite-sites model and the associated site-frequency spectrum	50
The Genealogical Structure of a Population	52
Mutation-migration-drift Equilibrium	54
Quantifying population structure: F_{ST}	54
Mutation-migration-drift equilibrium values of F_{ST}	55
3. THE GENETIC EFFECTIVE SIZE OF A POPULATION	59
General Considerations	60
Monoecy	61
Dioecy	63
Age Structure	65
Variable Population Size	67

Partial Inbreeding	68
Special Systems of Mating	69
Population Subdivision	72
Selection, Recombination, and Hitchhiking Effects	74
Effects from selection at unlinked loci	74
Selective sweeps and genetic draft	75
Background selection	77
4. THE NONADAPTIVE FORCES OF EVOLUTION	81
Relative Power of Mutation and Genetic Drift	82
Nucleotide diversity	82
Number of segregating sites	83
Alternative approaches	84
Empirical observations	85
Relative Power of Recombination and Genetic Drift	86
Number of recombinational events in a sample of alleles	87
Other approaches for narrow genomic intervals	89
Large-scale analysis	90
Empirical observations	92
Effective Population Size	94
Temporal change in allele frequencies	94
Single-sample estimators	96
Empirical observations	97
Mutation Rate	98
Divergence analysis	98
Short-term enrichment	100
Evolution of the mutation rate	103
Recombination Rate	106
Evolution of the recombination rate	107
General Implications	109
5. THE POPULATION GENETICS OF SELECTION	113
Single-locus Selection: Two Alleles	113
Viability selection	114
Expected time for allele-frequency change	116
Differential viability selection on the sexes	117
Frequency-dependent selection	118
Fertility/fecundity selection	118
Sexual selection	119
Wright's Formula	119
Adaptive topographies and Wright's formula	122
Single-locus Selection: Multiple Alleles	122
Marginal fitnesses and average excesses	122
Equilibrium frequencies with multiple alleles	124
Internal, corner, and edge equilibria and basins of attraction	125
Wright's formula with multiple alleles	126
Changes in genotypic fitnesses, W_{ij} , when additional loci are under selection	127
Selection on Two Loci	128
Dynamics of gamete-frequency change	129
Gametic equilibrium frequencies, linkage disequilibrium, and mean fitness	130
Results for particular fitness models	131
Phenotypic stabilizing selection and the maintenance of genetic variation	132
Selection on a Quantitative Trait Locus	135
Monogenic traits	136
Many loci of small effect underlying the character	136

A population-genetic derivation of the breeder's equation	138
Correct quadratic terms for s_i	141
6. THEOREMS OF NATURAL SELECTION:	
RESULTS OF PRICE, FISHER, AND ROBERTSON	145
Price's General Theorem of Selection	146
The life and times of George Price	146
Price's theorem, $R_z = \sigma(w_i, z_i) + E(w_i \bar{\delta}_i)$	147
The Robertson-Price identity, $S = \sigma(w, z)$	150
The breeder's equation, $R = h^2 S$	151
Fisher's Fundamental Theorem of Natural Selection	154
The classical interpretation of Fisher's fundamental theorem, $R_w = \sigma_A^2(w)$	154
What did Fisher really mean?	157
Implications of Fisher's Theorem for Trait Variation	158
Traits correlated with fitness have lower heritabilities	160
Traits correlated with fitness have higher levels of both additive and residual variance	162
Nonadditive genetic variance for traits under selection	164
Robertson's Secondary Theorem of Natural Selection	165
1968 version: $R_z = \sigma_A(w, z)$	165
1966 version: $R_z = \sigma(w, A_z)$	166
Accuracy of the secondary theorem	166
Connecting Robertson's results with those of Price, Fisher, and Lush	167
The Breeder's Equation Framed Within the Price Equation	168
Partial covariance and the spurious response to selection	168
Parent-offspring regressions before and after selection	171
Heywood's decomposition of response	172
7. INTERACTION OF SELECTION, MUTATION, AND DRIFT	175
Selection and Mutation at Single Loci	175
Selection and Drift at Single Loci	179
Probability of fixation under additive selection	180
Probability of fixation under arbitrary selection	185
Fixation of overdominant and underdominant alleles	187
Expected allele frequency in a particular generation	190
Joint Interaction of Selection, Drift, and Mutation	191
Haldane's Principle and the Mutation Load	194
Fixation Issues Involving Two Loci	197
The Hill-Robertson effect	197
Mutations with contextual effects	199
Stochastic tunneling	200
8. HITCHHIKING AND SELECTIVE SWEEPS	207
Sweeps: A Brief Overview	207
Hitchhiking, sweeps, and partial sweeps	207
Selection alters the coalescent structure at linked neutral sites	208
Hard vs. soft sweeps	211
The Behavior of a Neutral Locus Linked to a Selected Site	212
Allele-frequency change	212
Reduction in genetic diversity around a sweep	217
The Messer-Neher estimator of s	220
Recovery of variation following a sweep	220
Effects of sweeps on the variance in microsatellite copy number	221
The site-frequency spectrum	222
The pattern of linkage disequilibrium	224

Age of a sweep	226
Partial sweeps	226
Impacts of inbreeding	227
Summary: Signatures of a hard sweep	227
Soft Sweeps	227
Signatures of a soft sweep	229
Sweeps using standing variation	230
How likely is a sweep using standing variation?	231
“Hardening” and “softening” of a sweep	235
Recurrent mutation of the favorable allele cannot be ignored	236
Impact of geographic structure	239
Polygenic Adaptation	242
Genome-Wide Impact of Repeated Selection at Linked Sites	243
Association between levels of variation and localized recombination rates	244
Impact of recurrent hard sweeps on levels of neutral variation	245
A few large or many small sweeps?	247
Selective interference and the Hill-Robertson effect	250
Background selection: Reduction in variation under low recombination or selfing	251
Background selection vs. recurrent selective sweeps	254
Sweeps, background selection, and substitution rates	255
Sweeps, background selection, and codon usage bias	257
A paradigm shift away from the neutral theory of molecular evolution?	262
9. USING MOLECULAR DATA TO DETECT SELECTION:	
SIGNATURES FROM RECENT SINGLE EVENTS	265
An Overview of Strategies Based on Segregating Variation	266
Attempts to account for departures from the equilibrium model	268
SNP ascertainment bias	268
SNP polarity assignment errors	269
Background selection as the more appropriate null?	269
Structure of the remainder of this chapter	269
Allele-Frequency Change in a Single Population	269
Allele-frequency change over two sample points: The Waples adjusted test	270
Allele-frequency change over a time series: The Fisher-Ford test	272
Schaffer’s linear trend test	274
Scans and simulation-based approaches	275
Birthdate selection mapping (<i>BDSM</i>)	275
Divergence Between Populations: Two-population Comparisons	277
Divergence Between Populations: F_{ST} -based Tests	278
Outlier approaches	279
Tests based on F_{ST} -generated branch-lengths	280
The Lewontin-Krakauer test: Basics	280
Second-generation Lewontin-Krakauer tests: Model-based adjustments	282
Third-generation Lewontin-Krakauer tests: Correcting for population structure	283
Allele-Frequency Correlations With Environmental Variables	284
Joost’s spatial analysis method (<i>SAM</i>)	284
Accounting for population structure: Coop’s <i>Bayenv</i> and Fricot’s <i>LFMM</i>	286
Changes in the Chromosomal Pattern of Neutral Variation	289
Simple visual scans for changes in nucleotide and STR diversity	289
Tests based on STR variation across populations	291
Tests of sweeps using bottleneck models	292
Tests of sweeps using genomic positional information: <i>CLRT-GOF</i>	293
Tests of sweeps using genomic positional information: “ <i>SweepFinder</i> ”	295
Tests of sweeps using genomic positional information: <i>XP-CLR</i>	297
Ascertainment issues	299

Model fragility: Demography, mutation, recombination, and gene conversion	299
Tests Based on Site-frequency Spectrum Statistics	300
Summary statistics based on infinite-sites models	300
Tajima's D test	303
Achaz's Y and Y^* tests	305
Fu and Li's D^* and F^* tests	305
Fay and Wu's H test	306
Zeng et al.'s E test	307
Adjusting the null to account for nonequilibrium populations	307
Support via a preponderance of evidence	309
Recombination makes site-frequency tests conservative	311
Haplotype-based Tests	311
Defining and inferring haplotypes	312
Overview of haplotype-based tests	312
The Ewens-Watterson test	314
Other infinite-alleles tests: Conditioning on $\hat{\theta}$	315
Other infinite-alleles tests: Conditioning on S	316
Garud et al.'s H_{12} and H_2 tests	318
Recombination and infinite-alleles-based tests	318
Pairwise disequilibrium tests: Kelly's $Z_{n,S}$ and Kim and Nielsen's ω_{max}	319
Contrasting allele-frequency vs. intra-allelic estimates of haplotype age	320
Long haplotype tests using within-population data:	
$rEHH$, LDD , iHS , nS_L , SDS , and $DIND$	324
Long haplotype tests using between-population data:	
$XP-EHH$, Rsb , rHH , $rMHH$, and χ_{MD}	328
Summary: Tests based on haplotype/LD information	330
Searches for Selection: Humans	330
Recent and current selection in humans	331
Balancing selection in humans	333
Searches for Selection: Domesticated Organisms	334
The process of domestication	335
Finding domestication and improvement genes in crops	336
Domestication and improvement genes in rice	338
Domestication and improvement genes in maize	338
Relative strengths of selection on domestication vs. improvement genes	340
Silkmoths and flies	341
Constraints on finding domestication and improvement genes through selective signals	341
10. USING MOLECULAR DATA TO DETECT SELECTION:	
SIGNATURES FROM MULTIPLE HISTORICAL EVENTS	343
Brief Overview of Divergence-based Tests	344
A history of selection alters the ratio of polymorphic to divergent sites	344
A history of positive selection alters the ratio of silent- to replacement-site substitution rates	345
Divergence-based tests are biased toward conservative sites	346
What fraction of the genome is under functional constraints?	346
The HKA and McDonald-Kreitman Tests	347
The Hudson-Kreitman-Aguadé (HKA) test	347
The McDonald-Kreitman (MK) test: Basics	350
The McDonald-Kreitman test: Caveats	356
Dominance in fitness and the MK test	359
Fluctuating selection coefficients and MK tests	359
Recombinational bias in extended MK tests	360
Estimating Parameters of Adaptive Evolution	360

Estimating the fraction, α , of substitutions that are adaptive 360

How common are adaptive substitutions? 365

Estimating the rate, λ , of adaptive substitutions 367

The Sawyer-Hartl Poisson Random Field Model 369

 Basic structure of the model 369

 Bayesian extensions 374

 INSIGHT analysis of human transcription factors 376

Phylogeny-based Divergence Tests 377

 The K_a to K_s ratio, ω 378

 Parsimony-based ancestral reconstruction tests 379

 Maximum-likelihood-based codon tests 380

 Bayesian estimators of sites under positive selection 383

Connecting the Parameters of Adaptive Evolution 384

The Search for Selection: Closing Comments 385

 Caution is in order when declaring positive selection 386

 Curbing our enthusiasm 387

III. DRIFT AND QUANTITATIVE TRAITS 389

11. CHANGES IN GENETIC VARIANCE INDUCED BY DRIFT 391

Response of Within-population Genetic Variance to Drift 391

 Complete additivity 391

 The effects of dominance 392

 Quadratic components for inbred populations 393

 One- and two-locus identity coefficients 395

 Impact of drift under nonadditive variance 397

 The effects of epistasis 399

 Sampling error 403

 Empirical data 405

Covariance Between Inbred Relatives 411

 REML estimates 416

 Empirical observations 417

Drift-mutation Equilibrium 419

 Subdivided populations 422

12. THE NEUTRAL DIVERGENCE OF QUANTITATIVE TRAITS 425

Short-term divergence 426

 Sampling error 427

 Sample variance confidence intervals 429

 Empirical observations 431

 Estimating the among-group variance 432

 Lande's constant variance test, F_{CV} 433

Long-term Divergence 434

 Effectively neutral divergence and the estimation of rates of mutational variance ... 436

Testing the Null Hypothesis of Neutral Phenotypic Divergence: Rate-based Tests 438

 Rate tests 439

 Lande's Brownian-motion model of neutral trait evolution 439

 Tests based on the Brownian-motion model 441

 Ornstein-Uhlenbeck models 445

 Divergence in morphological traits 446

Time Series Divergence Tests 446

 Tests for departures from symmetric random walks 447

 Hunt's approach for comparing different models 448

Population Structure Based-tests: Q_{ST} versus F_{ST} 452

Q_{ST} : Partitioning additive variance over populations 452

<i>P_{ST}</i> : Approximating <i>Q_{ST}</i> with phenotypic data	454
Testing <i>Q_{ST}</i> versus <i>F_{ST}</i>	455
Empirical data	458
Closing comments: <i>Q_{ST}</i> , <i>F_{STQ}</i> , and linkage disequilibrium	460
Trait-augmented Marker-based Approaches: Tests Using QTL Information	462
Leveraging QTL studies	462
Orr's <i>QTLST</i> and <i>QTLST-EE</i> sign tests	462
Applications of QTL sign tests	465
Trait-augmented Marker-based Approaches: Tests Using GWAS Information	467
Approaches based on combining signals	467
Tests based on <i>tSDS</i> scores	467
The Berg and Coop <i>Q_x</i> test	468
Divergence in Gene Expression	469
Level of gene expression as a quantitative trait	469
Rate-based tests for neutrality in divergence of gene expression	470
Largely neutral evolution of expression levels in primates?	473
Transcriptional <i>Q_{ST}</i> , <i>tQ_{ST}</i>	474
<i>Cis</i> vs. <i>trans</i> , local vs. distant, and allele-specific expression (ASE)	474
Applications of sign-based tests to expression data	475
Evolution of expression levels: Drift, directional, or stabilizing selection?	477
IV. SHORT-TERM RESPONSE ON A SINGLE CHARACTER	479
13. SHORT-TERM CHANGES IN THE MEAN:	
1. THE BREEDER'S EQUATION	481
Single-generation Response: The Breeder's Equation	482
The breeder's equation: A general approximation for response	482
The importance of linearity	482
Response is the change in mean breeding value	483
Response under sex-dependent parent-offspring regressions	484
The selection intensity, \bar{i}	486
The Robertson-Price identity, $S = \sigma(w, z)$	486
Correcting for reproductive differences: Effective selection differentials	487
Expanding the Basic Breeder's Equation	488
Accuracy	489
Reducing environmental noise: Stratified mass selection	493
Reducing environmental noise: Repeated-measures selection	494
Adjustments for overlapping generations	496
Maximizing response under the breeder's equation	497
Maximizing the economic rate of response	499
Mean- versus variance-standardized response	499
BLUP Selection	500
The Multivariate Breeder's Equation	500
Response with two traits	501
Accounting for phenotypic correlations: The selection gradient	501
Accounting for genetic correlations: The Lande equation	502
Selection gradients and mean population fitness	503
Limitations of the Breeder's Equation	504
14. SHORT-TERM CHANGES IN THE MEAN:	
2. TRUNCATION AND THRESHOLD SELECTION	507
Truncation Selection	507
Selection intensities and differentials under truncation selection	507
Correcting the Selection Intensity for Finite Sample Sizes	509

Response in Discrete Traits: Binary Characters	512
The threshold/liability model	512
Direct selection on the threshold, T	516
The logistic regression model for binary traits	516
BLUP selection with binary data: Generalized linear mixed models	520
Response in Discrete Traits: Poisson-distributed Characters	522
15. SHORT-TERM CHANGES IN THE MEAN:	
3. PERMANENT VERSUS TRANSIENT RESPONSE	525
Why all the Focus on h^2 ?	525
Genetic Sources of Transient Response	526
Additive epistasis	526
Dominance in autotetraploids	529
Ancestral Regressions	530
Response due to Environmental Correlations	534
Selection in the Presence of Heritable Maternal Effects	537
Decomposing maternal effects	537
Selection response under Falconer's dilution model	538
Separate direct and maternal traits	543
Maternal selection vs. maternal inheritance	545
16. SHORT-TERM CHANGES IN THE VARIANCE:	
1. CHANGES IN THE ADDITIVE VARIANCE	549
Changes in Variance due to Gametic-Phase Disequilibrium	549
Changes in Variance Under the Infinitesimal Model	552
Within- and among-family variance under the infinitesimal model	554
Accounting for inbreeding and drift	556
Changes in Variance Under Truncation Selection	557
Changes in correlated characters	560
Directional truncation selection: Theory	561
Directional truncation selection: Experimental results	563
Effects of epistasis: Does the Griffing effect overpower the Bulmer effect?	563
Double truncation selection: Theory	564
Double truncation selection: Experimental results	565
Response under Normalizing Selection	567
Selection with Assortative Mating	569
Results using the infinitesimal model	569
Assortative mating and enhanced response	570
Disruptive selection, assortative mating, and reproductive isolation	572
17. SHORT-TERM CHANGES IN THE VARIANCE:	
2. CHANGES IN THE ENVIRONMENTAL VARIANCE	573
Background: Heritable Variation in σ_E^2	573
Scales of environmental sensitivity	573
Environmental vs. genetic canalization	574
Evidence for heritable variation in the environmental variance	575
Modeling Genetic Variation in σ_E^2	576
The multiplicative model	577
The exponential model	578
The additive model	580
The heritability of the environmental variance, h_v^2	581
Selection on σ_E^2	583
Translating the response in A_v into response in σ_E^2	583
Response from stabilizing selection on phenotypic value, z	584

Response from directional selection on z	585
Direct selection on σ_E^2 using repeated records	588
18. ANALYSIS OF SHORT-TERM SELECTION EXPERIMENTS:	
1. LEAST-SQUARES APPROACHES	591
Variance in Short-term Response	591
Expected variance in response generated by drift	592
Variance in predicted response versus variance in actual response	595
Realized Heritabilities	595
Estimators for several generations of selection	596
Weighted least-squares estimates of realized heritability	598
Standard errors of realized heritability estimates	600
Power: Estimation of h^2 from relatives or selection response?	601
Empirical versus predicted standard errors	603
Realized heritability with rank data	604
Infinitesimal-model corrections for disequilibrium	604
Experimental Evaluation of the Breeder's Equation	606
Most traits respond to selection	606
Sheridan's analysis	607
Realized heritabilities, selection intensity, and inbreeding	608
Asymmetric selection response	611
Reversed response	615
Control Populations and Experimental Designs	616
Basic theory of control populations	616
Divergent selection designs	618
Variance in response	618
Control populations and variance in response	619
Optimal Experimental Designs	620
Nicholas' criterion	621
Replicate lines	621
Line-cross Analysis of Selection Experiments	622
The simple additive model	622
The Hammond-Gardner model	623
Accounting for inbreeding depression and drift	628
19. ANALYSIS OF SHORT-TERM SELECTION EXPERIMENTS:	
2. MIXED-MODEL AND BAYESIAN APPROACHES	631
Mixed-model vs. Least-squares Analysis	631
BLUP selection	632
Basics of Mixed-model Analysis	633
REML estimation of unknown variance components	636
REML often returns variance estimates unbiased by selection	637
Animal-model Analysis of Selection Experiments	638
The basic animal model	638
Response is measured by change in mean breeding values	639
Fixed effects alter heritabilities	642
Model validation	642
Separating genetic and environmental trends	643
Validation that a trend is indeed genetic	645
Replicate lines	647
Estimating the additive variance at generation t	647
The Relationship Matrix, \mathbf{A} , Accounts for Drift and Disequilibrium	648
Modifications of the Basic Animal Model	651
Models with additional random effects	652
Common family and maternal effects	654

Treating certain breeding values as fixed effects	655
Dominance	656
Bayesian Mixed-model Analysis	659
Introduction to Bayesian statistics	659
Computing posteriors and marginals: MCMC and the Gibbs sampler	662
Bayesian analysis of the animal model	665
Application: Estimating selection response in pig litter-size components	666
LS, MM, or Bayes?	668
20. SELECTION RESPONSE IN NATURAL POPULATIONS	671
Evolution in Natural Populations: What Is the Target of Selection?	672
Direct and correlated responses	672
Environmentally generated correlations between fitness and traits	674
The Fisher-Price-Kirkpatrick-Arnold Model for Evolution of Breeding Date	676
Modifying the Breeder's Equation for Natural Populations	677
Complications in the absence of environmental change	678
Additional complications from environmental change	682
Is a Focal Trait the Direct Target of Selection?	682
Robertson's theorem: Response prediction without regard to the target of selection	682
Robertson consistency tests	683
Rauscher's consistency criteria	684
Morrissey et al.'s consistency criteria	686
The breeder's equation versus the secondary theorem	687
Applying Mixed Models to Natural Populations: Basics	688
Animal-model analysis in natural populations: Overview	689
Obtaining the relationship matrix: Direct observation of the pedigree	691
Obtaining the relationship matrix: Marker data	691
Consequences of pedigree errors	696
Model selection	697
Applying Mixed Models to Natural Populations	698
Consistency tests: Accuracy, reliability, and caveats when using PBVs	698
Bivariate animal models: REML estimates of $\sigma(A_z, A_w)$, S_A , and S_z	702
Next-generation analysis: Generalized mixed models	703
Next-generation analysis: Modeling missing data	704
Detecting genetic trends	706
Causes of Apparent Failures of Response in Natural Populations	709
Cryptic evolution: Genetic change masked by environmental change	711
Antler size in red deer: The focal trait is not the target of selection	713
Lower heritabilities in environments with stronger selection?	713
Fitness tradeoffs and multivariate constraints	714
V. SELECTION IN STRUCTURED POPULATIONS	717
21. FAMILY-BASED SELECTION	719
Introduction to Family-based Selection Schemes	719
Overview of the different types of family-based selection	720
Plant versus animal breeding	720
Among- versus within-family selection	722
Details of Family-based Selection Schemes	722
Selection and recombination units	722
Variations of the selection unit	723
Variations of the recombination unit	725
Theory of Expected Single-cycle Response	727
Modifications of the breeder's equation for predicting family-based response	727

The selection unit-offspring covariance, $\sigma(x, y)$	731
Variance of the selection unit, σ_x^2	733
Response for Particular Designs	736
Overview of among- and within-family response	736
Among-family selection	737
Among-family selection: Which scheme is best?	740
Within-family selection	741
Realized heritabilities	743
Accounting for epistasis	744
Response with autotetraploids	745
Efficiency of Family-based Vs. Individual Selection	749
The relative accuracies of family-based vs. individual selection	749
Comparing selection intensities: Finite size corrections	753
Within-family selection has additional long-term advantages	754
Response when Families are Replicated Over Environments	755
Among-family variance under replication	755
Ear-to-row selection	758
Modified ear-to-row selection	758
Selection on a Family Index	761
Response to selection on a family index	762
Lush's optimal index	763
Correcting the selection intensity for correlated variables	766

22. ASSOCIATIVE EFFECTS: COMPETITION, SOCIAL INTERACTIONS, GROUP AND KIN SELECTION 769

Direct Versus Associative Effects	770
Early models of competition	771
Direct and associative effects	771
Animal well-being and the improvement of the heritable social environment	773
What do we mean by group?	773
Trait- vs. variance component-based models	774
The total breeding value (TBV) and T^2	775
A_s as a function of group size	778
Selection In the Presence of Associative Effects	779
Individual selection: Theory	780
Individual selection: Direct vs. social response	782
Individual selection: Maternal effects	783
Group selection: Theory	784
Group selection: Direct vs. social response	788
Group selection: Experimental evidence	788
Incorporating Both Individual and Group Information	789
Response on a weighted index	789
Optimal response	793
BLUP Estimation of Direct and Associative Effects	796
Mixed-model estimation of direct and associative effects	796
Muir's experiment: BLUP selection for quail weight	800
Details: Environmental group effects and the covariance structure of \mathbf{e}	802
Details: Ignoring additive social values introduces bias	804
Details: Identifiability of variance components	805
Appropriate designs for estimating direct and associative effects	806
Using kin groups: A quick-and-dirty way around associative effects?	807
Associative Effects, Inclusive Fitness, and Fisher's Theorem	807
Change in mean fitness when associative effects are present	807
Inclusive fitness	810
Bijma's theorem: Inclusive fitness and Fisher's fundamental theorem	812

Hamilton's rule	813
How general is Hamilton's rule?	813
Queller's generalization of Hamilton's rule	815
Group Selection, Kin Selection, and Associative Effects	815
Kin, group, and multilevel selection	815
Much ado about nothing?	816
Group and kin selection: Models without trait associative effects	817
Group and kin selection in the associative-effects framework	821
Closing comments	823
23. SELECTION UNDER INBREEDING	825
Basic Issues in Selection Response Under Inbreeding	826
Accounting for inbreeding depression	826
Response under small amounts of inbreeding	827
Using ancestral regressions to predict response	828
The covariance between inbred relatives	830
Limitations	830
Family Selection with Inbreeding and Random Mating	831
Family selection using inbred parents	833
Progeny testing using inbred offspring	835
S_1 , S_2 , and $S_{i,j}$ family selection	836
Other inbreeding-based family-selection schemes	840
Cycles of inbreeding and outcrossing	840
Individual Selection Under Pure Selfing	842
Response under pure selfing	843
Response when inbreeding pure-line crosses	846
The Bulmer effect under selfing	847
Family Selection Under Pure Selfing	849
The covariance between relatives in a structured selfing population	850
Response to family selection	853
Within-family selection under selfing	855
Combined selection	856
Response Under Partial Selfing	859
An approximate treatment using covariances	859
A more careful treatment: Kelly's structured linear model	861
Conclusions: An Incomplete Theory for Short-term Response	864
The Evolution of Selfing Rates	865
Automatic selection, inbreeding depression, and reproductive assurance	865
The Lande-Schemske model: Theory	867
The Lande-Schemske model: Data	867
Baker's Law and the demographic advantages of selfing	869
Group-level selection against selfing	869
VI. POPULATION-GENETIC MODELS OF TRAIT RESPONSE	873
24. THE INFINITESIMAL MODEL AND ITS EXTENSIONS	875
The Infinitesimal: A Family of Models	876
The Infinitesimal Genetics Model: Empirical Data	877
Theoretical Implications of the Infinitesimal Genetics Model	879
Selection does not change allele frequencies	879
Accounting for dominance	880
Disequilibrium	881
Theoretical Implications of the Standard Infinitesimal Model	881

What generates a Gaussian distribution within a family?	881
Modifications of the Fisher-Bulmer infinitesimal model	882
Gaussian Continuum-of-alleles Models	883
Infinite-alleles and continuum-of-alleles models	883
Drift	884
Drift and a finite number of loci	885
The effective number of loci, n_e	887
Dynamics: σ_a^2 and d change on different time scales	888
How robust is the Gaussian continuum-of-alleles model?	889
The Bulmer Effect Under Linkage	890
An approximate treatment	890
A more careful treatment	892
Response Under Non-Gaussian Distributions	895
Describing the genotypic distribution: Moments	895
Describing the genotypic distribution: Cumulants and Gram-Charlier series	898
Application: Departure from normality under truncation selection	900
Short-term response ignoring linkage disequilibrium	902
Gaussian versus rare-alleles approximations	905
Short-term response ignoring allele-frequency change	909
Effects of linkage	911
Summary: Where Does All This Modeling Leave Us?	911
25. LONG-TERM RESPONSE:	
1. DETERMINISTIC ASPECTS	913
Idealized Long-term Response in a Large Population	913
Deterministic Single-locus Theory	916
Expected contribution from a single locus	916
Dudley's estimators of a , n , and p_0	917
Dynamics of allele-frequency change	918
Major Genes Versus Polygenic Response: Theory	922
Lande's model: Response with a major gene in an infinitesimal background	922
Major Genes Versus Polygenic Response: Data	927
Major genes appear to be important in response to anthropogenically induced selection	927
What is the genetic architecture of response in long-term selection experiments?	928
An Overview of Long-term Selection Experiments	929
Estimating selection limits and half-lives	930
General features of long-term selection experiments	932
The nature of selection limits	935
Increases in Variances and Accelerated Responses	937
Rare alleles	937
Major mutations	938
Scale and environmental impacts on variances	941
Linkage effects	941
Epistasis	943
Conflicts Between Natural and Artificial Selection	944
Accumulation of lethals in selected lines	946
Lerner's model of genetic homeostasis	949
Artificial selection countered by natural stabilizing selection	950
26. LONG-TERM RESPONSE:	
2. FINITE POPULATION SIZE AND MUTATION	953
The Population Genetics of Selection and Drift	954
Fixation probabilities for alleles at a QTL	955
Increased recombination rates following selection	956
The Effect of Selection on Effective Population Size	956

The expected reduction in N_e from directional selection	957
Drift and Long-term Selection Response	961
Basic theory	961
Robertson's theory of selection limits	962
Tests of Robertson's Theory of Selection Limits	965
Weber's selection experiments on <i>Drosophila</i> flight speed	967
The Effects of Linkage on the Selection Limit	969
Optimal Selection Intensities for Maximizing Long-term Response	972
Effects of Population Structure on Long-term Response	974
Founder effects and population bottlenecks	974
Population subdivision	977
Within-family selection	979
Asymptotic Response due to Mutational Input	981
Results for the infinitesimal model	981
Expected asymptotic response under more general conditions	985
Additional models of mutational effects	987
Optimizing the asymptotic selection response	988
27. LONG-TERM RESPONSE:	
3. ADAPTIVE WALKS	991
Fisher's Model: The Adaptive Geometry of New Mutations	991
Fisher-Kimura-Orr adaptive walks	994
The cost of pleiotropy	999
Adaptive walks under a moving optimum	1001
Walks in Sequence Space: Maynard-Smith-Gillespie-Orr Adaptive Walks	1002
SSWM models and the mutational landscape	1003
Extreme-value theory (EVT)	1003
Structure of adaptive walks under the SSWM model	1005
The fitness distribution of beneficial alleles	1009
Fisher's Geometry or EVT?	1010
The Importance of History in Walks: Lessons From Lenksi's LTEE	1012
28. MAINTENANCE OF QUANTITATIVE GENETIC VARIATION	1015
Overview: The Maintenance of Variation	1015
Maintaining genetic variation for quantitative traits	1016
Mutation-drift Equilibrium	1018
Mutational models and quantitative variation	1018
Maintenance of Variation by Direct Selection	1021
Fitness models of stabilizing selection	1021
Stabilizing selection on a single trait	1023
Stabilizing selection on multiple traits	1024
Stabilizing selection countered by pleiotropic overdominance	1026
Fluctuating and frequency-dependent stabilizing selection	1027
Summary of direct-selection models	1028
Neutral Traits With Pleiotropic Overdominance	1028
Mutation-stabilizing Selection Balance: Basic Models	1030
Latter-Bulmer diallelic models	1031
Kimura-Lande-Fleming continuum-of-alleles models	1033
Gaussian versus house-of-cards approximations for continuum-of-alleles models	1035
Epistasis	1039
Effects of linkage and mating systems	1039
Spatial and temporal variation in the optimum	1040
Summary: Implications of Gaussian versus HCA approximations	1042
Mutation-stabilizing Selection Balance: Drift	1050
Impact on equilibrium variances	1050

Near neutrality at the underlying loci?	1051
Mutation-stabilizing Selection Balance: Pleiotropy	1052
Gaussian results	1053
HCA results	1055
Maintenance of Variation by Pleiotropic Deleterious Alleles	1058
The Hill-Keightley pleiotropic side-effects model	1058
Deleterious pleiotropy-stabilizing selection (joint-effects) models	1065
How Well do the Models Fit the Data?	1069
Strength of selection: Direct selection on a trait	1070
Strength of selection: Persistence times of new mutants	1073
Number of loci and mutation rates	1074
What Does Genetic Architecture Tell Us?	1075
Accelerated responses in artificial selection experiments	1076
Kelly's test for rare recessives	1077
Summary: What Forces Maintain Quantitative-genetic Variation?	1077

VII. MEASURING SELECTION ON TRAITS 1079

29. INDIVIDUAL FITNESS AND THE MEASUREMENT OF

UNIVARIATE SELECTION 1081	
Episodes of Selection and the Assignment of Fitness	1082
Fitness components	1082
Assigning fitness components	1083
Potential issues with assigning discrete fitness values	1086
Assigning components of offspring fitness to their mothers	1086
Concurrent selective episodes, reproductive timing, and individual fitness, λ_{ind} ..	1087
Sensitivities and elasticities of the elements of L	1090
Variance in Individual Fitness	1091
Partitioning I across episodes of selection	1094
Correcting lifetime reproductive success for random offspring mortality	1095
Caveats in using the opportunity for selection	1095
Measuring Sexual Selection	1097
Bateman's principles	1098
Variance in mating success	1099
The sexual selection, or Bateman, gradient	1102
Describing Phenotypic Selection: Introductory Remarks	1104
Fitness surfaces and landscapes	1104
Describing Phenotypic Selection: Changes in Phenotypic Moments	1106
Henshaw's distributional selection differential (DSD)	1107
Directional selection	1107
Quadratic selection	1108
Under trait normality, gradients describe the local geometry of the fitness landscape	1109
Under trait normality, gradients appear in selection response equations	1110
Partitioning changes in means and variances into episodes of selection	1110
Choice of the reference population: Independent partitioning	1112
Standard errors for estimates of differentials and gradients	1113
Describing Phenotypic Selection: Individual Fitness Surfaces	1114
Linear and quadratic approximations of $W(z)$	1115
Lande-Arnold fitness regressions	1117
The geometry of quadratic fitness functions	1119
Hypothesis testing, approximate confidence intervals, and model validation	1120
Power	1122
Mean-standardized gradients and fitness elasticities	1123
Moving Away From Quadratic Fitness Functions	1125

Quadratic surfaces can be very misleading	1125
Gaussian and exponential fitness functions	1126
Semiparametric approaches: Schluter's cubic-spline estimate	1128
Janzen-Stein and Morrissey-Sakrejda gradients: Calculating average and landscape gradients under general fitness functions	1128
More Realistic Models of the Distribution of Fitness Components	1129
Generalized linear models for fitness components	1129
Aster models: Modeling the distribution of total fitness	1133
The Importance of Experimental Manipulation	1134
Performance and eco-evolutionary surfaces	1135
30. MEASURING MULTIVARIATE SELECTION	1139
Selection on Multivariate Phenotypes: Differentials and Gradients	1139
Changes in the mean vector: The directional selection differential, \mathbf{S}	1140
The directional selection gradient vector, β	1140
Directional gradients, fitness surface geometry, and selection response	1143
Changes in the covariance matrix: The quadratic selection differential matrix, \mathbf{C}	1144
The quadratic selection gradient matrix, γ	1146
Quadratic gradients, fitness surface geometry, and selection response	1148
Fitness surface curvature and within-generation changes in variances and covariances	1148
Multidimensional Quadratic Fitness Regressions	1149
Estimation, hypothesis testing, and confidence intervals	1150
Regression packages and coefficients of γ	1151
Geometric aspects	1152
A brief digression: Orthonormal and diagonalized matrices	1153
Canonical transformation of γ	1154
Are traits based on canonical axes meaningful?	1157
Strength of selection: γ_{ii} versus λ	1158
Significance and confidence regions for a stationary point	1159
Using Aster models to estimate fitness surfaces	1159
Multivariate Semiparametric Fitness Surface Estimation	1160
Projection-pursuit regression and thin-plate splines	1162
Gradients for general fitness surfaces	1163
Calsbeek's tensor approach for detecting variation in fitness surfaces	1163
Model selection	1164
The Strength and Pattern of Selection in Natural Populations	1165
Meta-analysis	1165
Kingsolver's analysis	1166
Directional selection: Strong or weak?	1168
Total versus direct selection, tradeoffs, and temporal variation	1171
Directional selection on body size and Cope's law	1173
Quadratic selection: Strong or weak?	1173
Where is all the stabilizing selection?	1175
A plea to fully publish	1175
Unmeasured Characters and Other Biological Caveats	1175
Path Analysis and Fitness Estimation	1177
Regressions versus path analysis	1179
Morrissey's extended selection gradient vector, η	1181
Selection on latent variables	1183
Elasticity path diagrams	1184
Levels of Selection	1186
Contextual analysis	1186
Selection can be antagonistic across levels	1187
Group selection is likely density-dependent	1188
Selection differentials can be misleading in levels of selection	1188

Hard, soft, and group selection: A contextual analysis viewpoint	1190
Early survival: Offspring or maternal fitness component?	1192

VIII. APPENDICES 1197

A1. DIFFUSION THEORY 1199

Foundations of Diffusion Theory	1199
The infinitesimal mean, $m(x)$, and variance, $v(x)$	1199
The Kolmogorov forward equation	1200
Boundary behavior of a diffusion	1202
Derivation of the Kolmogorov forward equation	1202
Stationary distributions	1203
The Kolmogorov backward equation	1205
Diffusion Applications in Population Genetics	1205
Probability of fixation	1206
Time to fixation	1208
Expectations of more general functions	1211
Applications in Quantitative Genetics	1212
Brownian-motion models	1212
Ornstein-Uhlenbeck models	1215

A2. INTRODUCTION TO BAYESIAN ANALYSIS 1217

Why are Bayesian Methods Becoming More Popular?	1217
Bayes' Theorem	1218
From Likelihood to Bayesian Analysis	1220
Marginal posterior distributions	1221
Summarizing the posterior distribution	1221
Highest density regions (HDRs)	1222
Bayes factors and hypothesis testing	1222
The Choice of a Prior	1224
Diffuse priors	1224
The Jeffreys prior	1225
Posterior Distributions Under Normality Assumptions	1227
Gaussian likelihood with known variance and unknown mean	1227
Gamma, χ^2 , inverse-gamma, and χ^{-2} distributions	1228
Gaussian likelihood with unknown variance: Scaled inverse- χ^2 priors	1231
Student's t distribution	1232
General Gaussian likelihood: Unknown mean and variance	1232
Conjugate Priors	1233
The beta and Dirichlet distributions	1233
Wishart and inverse-Wishart distributions	1235

A3. MARKOV CHAIN MONTE CARLO AND GIBBS SAMPLING 1237

Monte Carlo Integration	1237
Importance sampling	1239
Introduction to Markov Chains	1240
The Metropolis-Hastings Algorithm	1243
Burning-in the sampler	1246
Simulated annealing	1247
Choosing a jumping (proposal) distribution	1247
Autocorrelation and sample size inflation	1248
The Monte Carlo variance of an MCMC-based estimate	1250
Convergence Diagnostics	1251
Visual analysis	1251

More formal approaches	1252
Practical MCMC: How many chains and how long should they run?	1253
The Gibbs Sampler	1253
Using the Gibbs sampler to approximate marginal distributions	1255
Rejection Sampling and Approximate Bayesian Computation (ABC)	1256
A4. MULTIPLE COMPARISONS: BONFERRONI CORRECTIONS, FALSE-DISCOVERY RATES, AND META-ANALYSIS	1259
Combining p Values Over Independent Tests	1260
Fisher's χ^2 method	1260
Stouffer's Z score	1261
Bonferroni Corrections and Their Extensions	1262
Standard Bonferroni corrections	1262
Sequential Bonferroni corrections	1263
Holm's method	1263
Simes-Hochberg method	1264
Hommel's method	1264
Cheverud's method and other approaches for dealing with dependence	1265
Detecting an Excess Number of Significant Tests	1266
How many false positives?	1266
Schweder-Spjøtvoll plots	1267
Estimating n_0 : Subsampling from a uniform distribution	1267
Estimating n_0 : Mixture models	1270
FDR: The False-discovery Rate	1271
Morton's posterior error rate (PER) and the FDR	1272
A technical aside: Different definitions of false-discovery rate	1275
The Benjamini-Hochberg FDR estimator	1276
A (slightly more) formal derivation of the estimated FDR	1277
Storey's q value	1278
Closing caveats in using the FDR	1279
Formal Meta-analysis	1279
Informal, or narrative, meta-analysis	1279
Standardizing effect sizes	1280
Fixed-effects, random-effects, and mixed-model meta-analysis	1282
Publication and other sources in bias	1284
Bias when estimating magnitudes	1287
A5. THE GEOMETRY OF VECTORS AND MATRICES: EIGENVALUES AND EIGENVECTORS	1291
The Geometry of Vectors and Matrices	1291
Comparing vectors: Lengths and angles	1291
Matrices describe vector transformations	1293
Orthonormal matrices: Rigid rotations	1294
Eigenvalues and eigenvectors	1294
Properties of Symmetric Matrices	1297
Correlations can be removed by a matrix transformation	1299
Simultaneous diagonalization	1301
Canonical Axes of Quadratic Forms	1302
Implications for the multivariate normal distribution	1304
Principal components of the variance-covariance matrix	1305
Testing for Multivariate Normality	1307
Graphical tests: Chi-square plots	1307
Mardia's test: Multivariate skewness and kurtosis	1309

A6. DERIVATIVES OF VECTORS AND VECTOR-VALUED FUNCTIONS	1311
Derivatives of Vectors and Vector-valued Functions	1311
The Hessian Matrix, Local Maxima/Minima, and Multidimensional Taylor Series ...	1315
Optimization Under Constraints	1317
LITERATURE CITED	1319
AUTHOR INDEX	1411
ORGANISM AND TRAIT INDEX	1427
SUBJECT INDEX	1437
