# Table of Contents

	<b>To the Student</b>	vi
	<b>Laboratory Safety</b>	vii
	<b>Laboratory Notebooks and Reports</b>	ix
	<b>Some Common Laboratory Glassware and Tools</b>	xii
1)	<b>A. Measurement and Expression of Experimental Data</b>	1
	<b>B. Graphing and Statistical Analysis</b>	13
	<i>A math review, including practice with significant figures, rounding rules, graphing techniques, and statistical analysis.</i>	
2)	<b>A Submarine Adventure: Density Saves the Day</b>	27
	<i>The concept of density is explored by measuring the density of a solid and a liquid and by developing a mock submarine.</i>	
3)	<b>Conservation of Matter</b>	42
	<i>A reaction of copper nitrate and zinc is observed to determine if mass is conserved.</i>	
4)	<b>Plop, Plop, Fizz, Fizz: The Mass Percent of NaHCO<sub>3</sub></b>	54
	<i>The reaction of Alka-Seltzer® tablets with acetic acid is used to determine the mass percent of sodium bicarbonate present in each tablet.</i>	
5)	<b>Proof of Alcohol</b>	64
	<i>An unknown alcohol solution is analyzed for the mass and volume percent of alcohol by separation methods.</i>	
6)	<b>Empirical Formula of a Compound</b>	78
	<i>An unknown sample is analyzed for the empirical formula of a metal sample via a crucible and heating.</i>	
7)	<b>Limiting and Excess Reagents</b>	86
	<i>Copper nitrate and potassium iodide are reacted at different concentrations to determine which is the limiting reagent and which is in excess.</i>	
8)	<b>Redox Reactions in Voltaic Cells: Construction of a Potential Series</b>	99
	<i>Microscale unit cells of several metals are created and their potentials are measured to create a potential series.</i>	
9)	<b>Reactions in Aqueous Solutions: Strong Acids and Bases</b>	110
	<i>The pH and concentration relationships for the reaction of HCl and NaOH are investigated.</i>	

<b>10)</b>	<b>The Copper Cycle</b> <i>Watch copper metal react in various ways to transform from a solid to a liquid back to a solid through a series of reactions.</i>	<b>123</b>
<b>11)</b>	<b>Atomic Spectra</b> <i>Several unknown light sources are identified by use of spectrometry.</i>	<b>134</b>
<b>12)</b>	<b>Halogen Reactions</b> <i>Hexane and water are used to determine the solubility of the halogens and halides.</i>	<b>145</b>
<b>13)</b>	<b>Building Molecular Models</b> <i>Lewis structures are presented in model form and investigated.</i>	<b>155</b>
<b>14)</b>	<b>Calorimetry and Hess's Law</b> <i>The enthalpies of reaction are determined for both magnesium metal and magnesium oxide in water. These enthalpies are then used in conjunction with Hess's Law to determine the enthalpy of reaction for magnesium burning in oxygen.</i>	<b>166</b>
<b>15)</b>	<b>Gas Laws and Air Bags</b> <i>Ideal gas law and stoichiometry are used to construct a working mock-up of an automobile airbag.</i>	<b>184</b>
<b>16)</b>	<b>Intermolecular Forces and the Triple Point of CO<sub>2</sub></b> <i>Intermolecular forces are investigated by observing the temperature depression created when different solvents evaporate. The triple point of CO<sub>2</sub> is observed and measured.</i>	<b>193</b>
<b>17)</b>	<b>The Purification of Water</b> <i>Fresh water samples are tested for phosphate before and after purification.</i>	<b>204</b>
<b>18)</b>	<b>Kinetics: The Iodine Clock</b> <i>The iodine clock reaction is measured at room, high, and low temperatures and its rate constant is determined.</i>	<b>219</b>
<b>19)</b>	<b>Photometric Determination of an Equilibrium Constant</b> <i>The equilibrium constant for the reaction of iron(III) thiocyanate is determined by photometric methods.</i>	<b>234</b>
<b>20)</b>	<b>Titration of 7UP®</b> <i>Monoprotic and polyprotic acids are titrated using NaOH.</i>	<b>246</b>

21)	<b>Hydrogen Phosphate Buffer Systems</b> <i>Students create and then test the buffering capacity of a hydrogen phosphate buffer.</i>	258
22)	<b>Entropy, Free Energy, and Chemical Equilibrium</b> <i>The thermodynamics of the solubility of <math>\text{Ca}(\text{OH})_2</math> are determined using titration.</i>	270
23)	<b>Electrochemistry: The Nernst Equation</b> <i>Unit cells are built from various metals and then tested at several temperatures. The free energy is determined using the Nernst equation.</i>	283
24)	<b>Qualitative Analysis: Anions</b> <i>Qualitative analysis is used to investigate the chemical properties of 11 anions, and those properties are used to identify the anions in an unknown sample.</i>	295
25)	<b>Qualitative Analysis: Cations</b> <i>A traditional qualitative analysis scheme is used to determine the group I–V cations in an unknown mixture.</i>	307
26)	<b>Qualitative Analysis: Cations, Anions, and Complex Ions</b> <i>A single-day, microscale qualitative analysis is used to determine the cations and anions in an unknown mixture.</i>	323
27)	<b>Whodunit? A Forensic Investigation</b> <i>A murder is investigated by means of several chemical forensic methods.</i>	336
28)	<b>Chemical Structure and Smell</b> <i>Several organic chemicals are investigated by relating their functional groups and structural similarities to their odors.</i>	350
29)	<b>Proteins, Carbohydrates, and Fats: Analysis of a Peanut</b> <i>The biochemical composition of a peanut is analyzed by use of acrolein, Fehling, and xanthoproteic chemical tests.</i>	356
	<b>Appendix A: Glossary of Terms Used in This Manual</b>	A-1
	<b>Appendix B: Excel Tutorial</b>	A-3
	<b>Appendix C: Volumetric Glassware</b>	A-15
	<b>Appendix D: Standard Reduction Potentials (in Volts), 25 °C</b>	A-18
